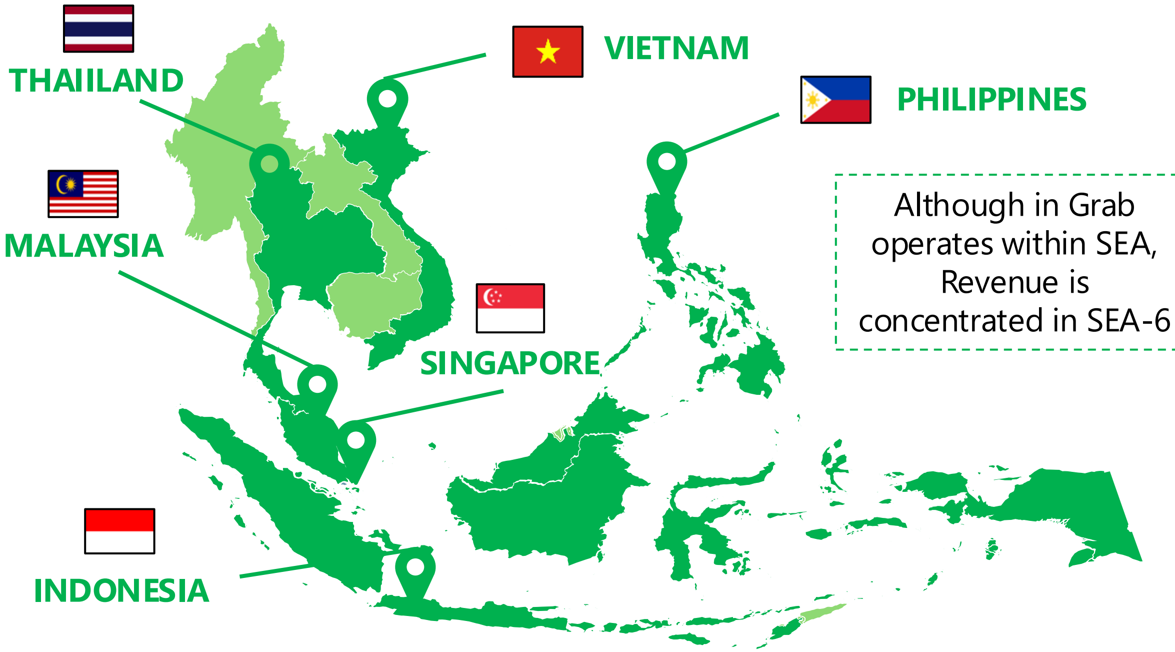
Company Overview

Southeast Asia's leading platform for Mobility and Commerce…

Industry Titan within Southeast Asia…



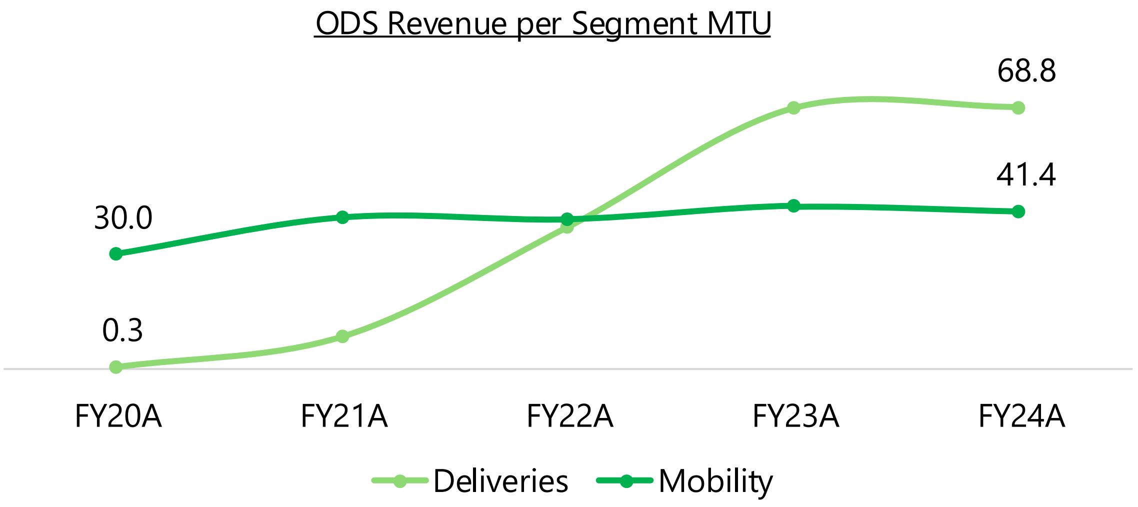
Although in Grab operates within SEA, Revenue is concentrated in SEA-6

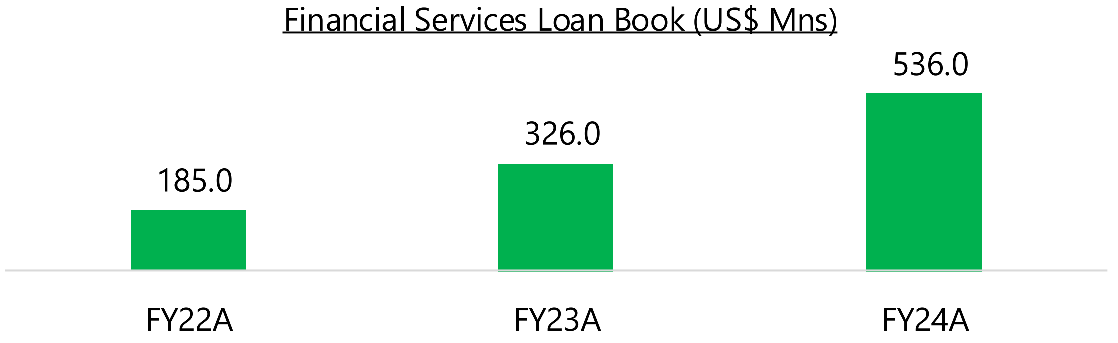
>500 cities and towns across **Southeast Asia**

99% of Grab's total revenues from **SEA-6**

91% of Grab's revenues from **Mobility & Deliveries**

…Monetising at Scale Across Mobility, Deliveries and Fintech…





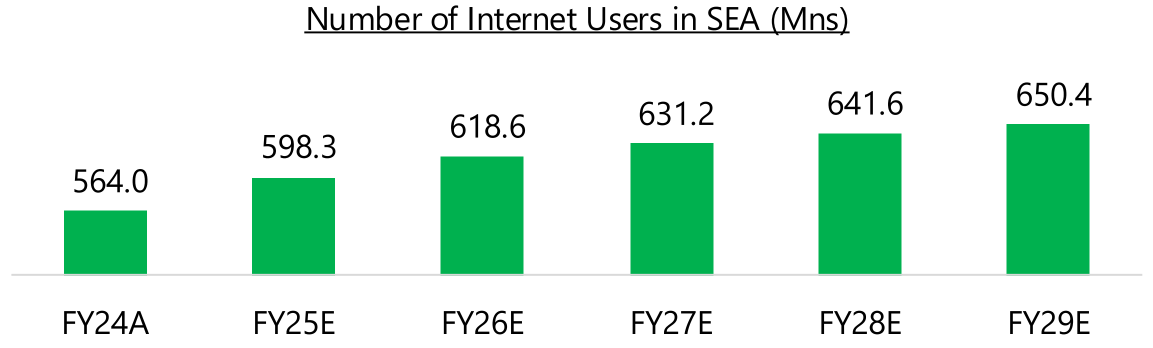
Rising MTU monetisation and a rapidly scaling loan book underscore **improving platform economics**

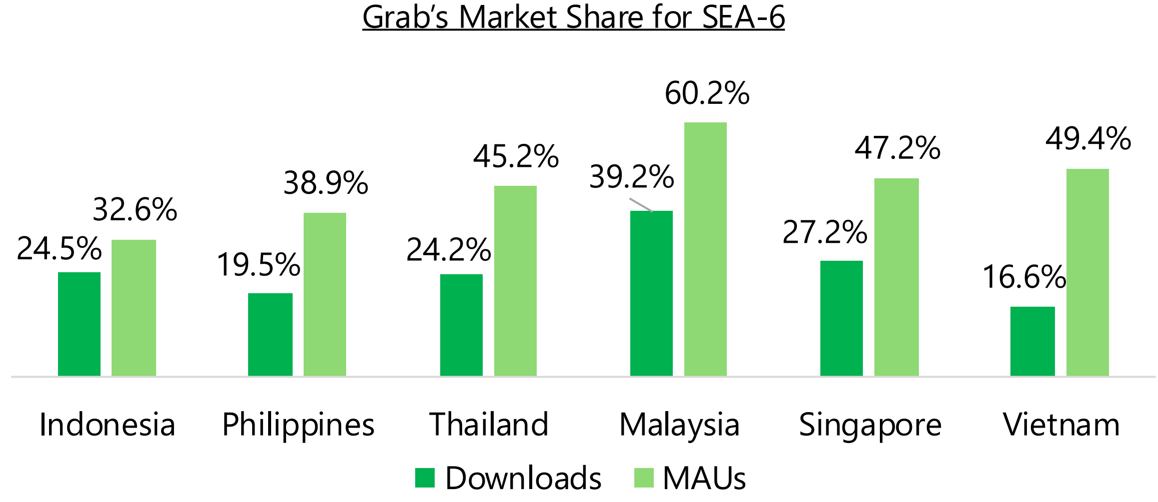
Source: Team Analysis, Company Filings

Industry Overview

Strong market leadership primes Grab to emerge as the winner of these growing markets…

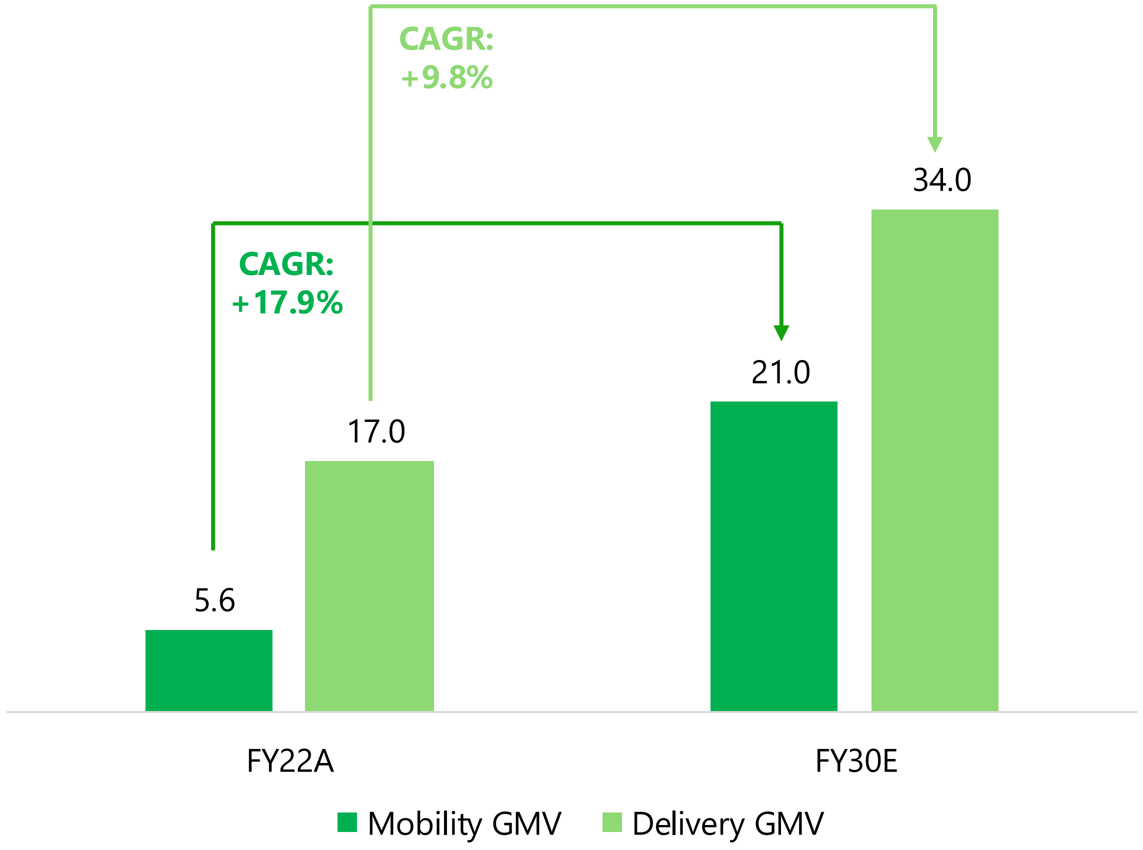
Favourable Macro Conditions and Market Positioning…





Rising internet penetration **reinforces Grab's scale** across Southeast Asia markets

…Support Grab's Growth in Mobilities & Deliveries



Expected GMV growth across mobility and deliveries reflects **strong demand** and **network scale advantages**

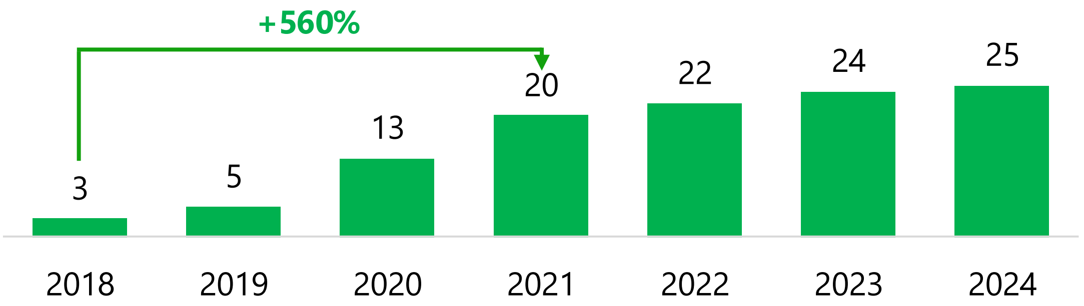
Source: WorldBank, Statista, Team Analysis

Industry Overview

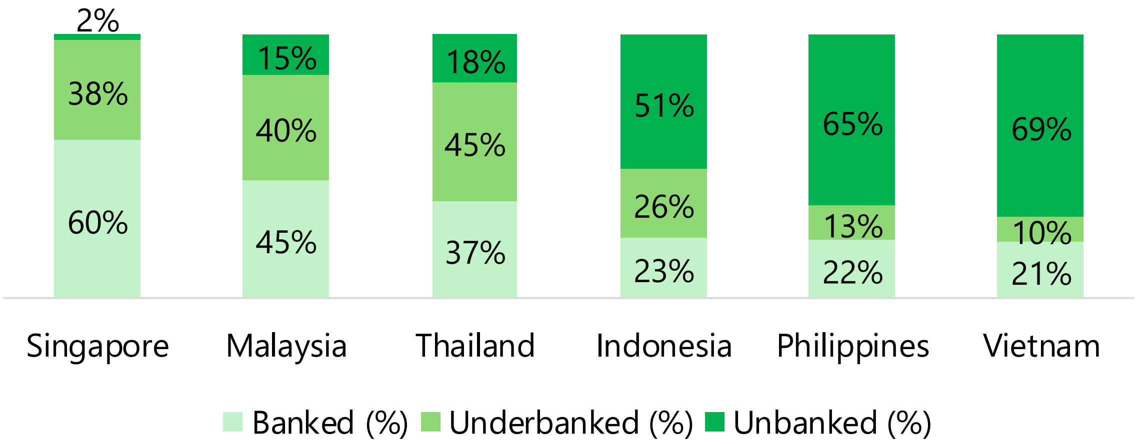
Poised to increase market share in an underserved market…

A Growing Digital Financial Services Industry…

Number of Digital Banks in SEA



Access to Financial Services by Country



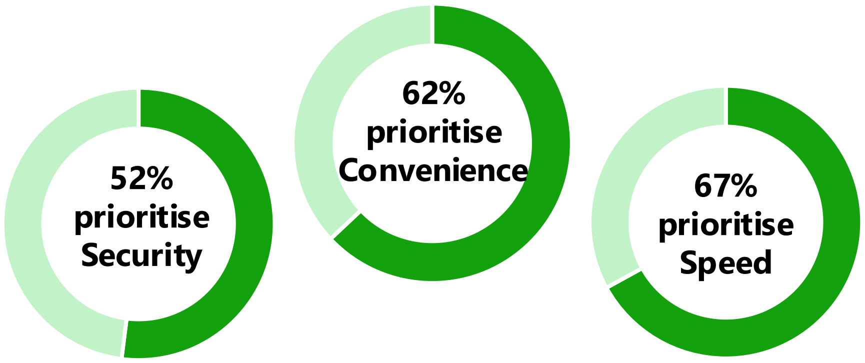
Large underbanked populations underpin **strong demand** for embedded digital financial services

…Which Grab is BEST Positioned to Dominate

Jenn Ong, Head of Retail Banking at GXS Bank

Grab's merchant and driver network further expands GXS's reach particularly in developing markets, strengthening and broadening Grab's ecosystem economics

Consumer Preferences in Choosing Payment Services



Grab's integrated ecosystem directly aligns with consumer demand for convenience, speed and security, **reinforcing platform stickiness**

Source: Bain, Google, Temasek, Bloomberg Intelligence, Twimbit, HSBC, Team Analysis

Thesis One - Growth Via Structural Tourism Monetisation

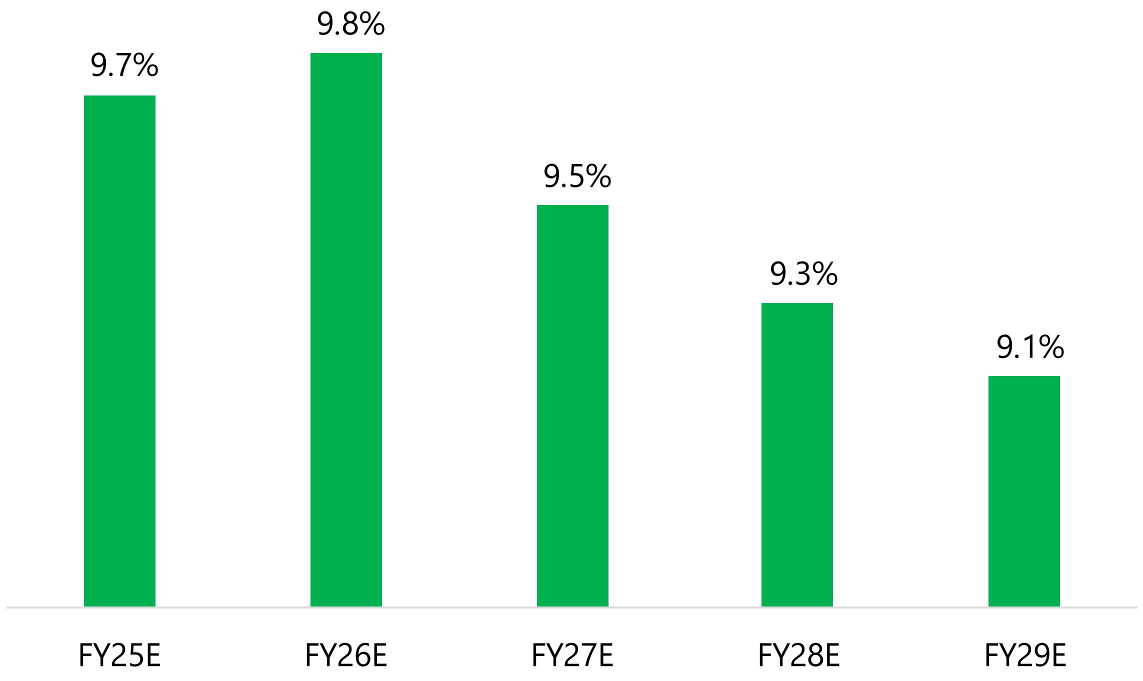
Unlocks incremental, higher-quality demand for Grab's services…

Growth Via Structural Tourism Monetisation

An underappreciated, structurally high-margin growth engine for Grab…

Tourism is Forecasted to Grow Robustly…

Revenue Weighted Tourism Spending Growth Rate



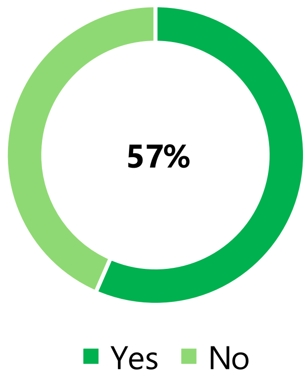
50% of existing users **use the Grab** app when travelling in SEA

57% YoY growth in **travelers** using the Grab app

…Allowing Grab to Take Advantage of Their Price Inelasticity…

Spending Comparison Between Locals and Tourists

Share of Tourists That do not Have or Exceed Their Travel Budgets



Tourists' preference for convenience and luxury result in them being **even more than drivers** of incremental volume growth, but also **drivers of higher margin** services Grab provides

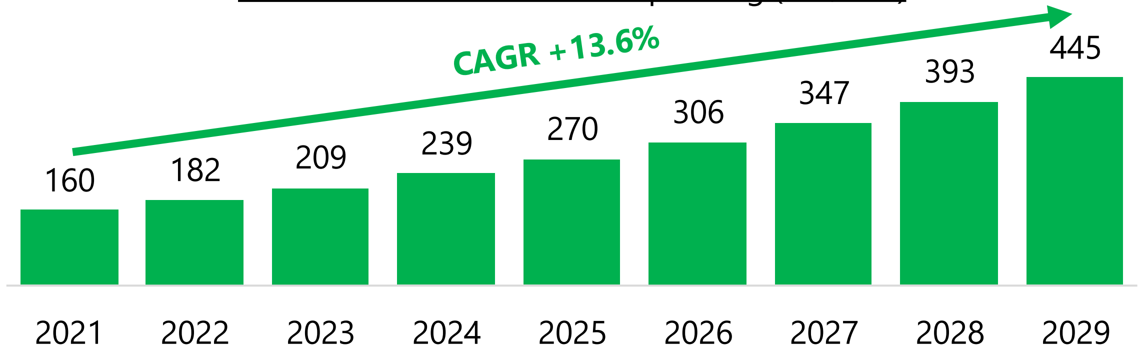
Source: Euromonitor, Grab 2024 SEA Travel Insights, Team Analysis

Growth Via Structural Tourism Monetisation

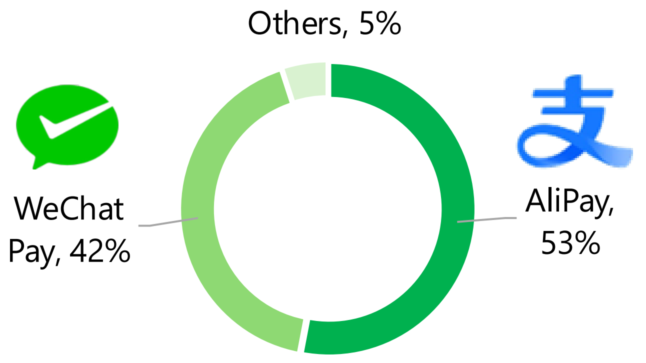
Structurally lifting Grab's unit economics…

…Capturing Southeast Asia's largest tourism source…

Chinese Outbound Tourism Spending (US$ Bns)



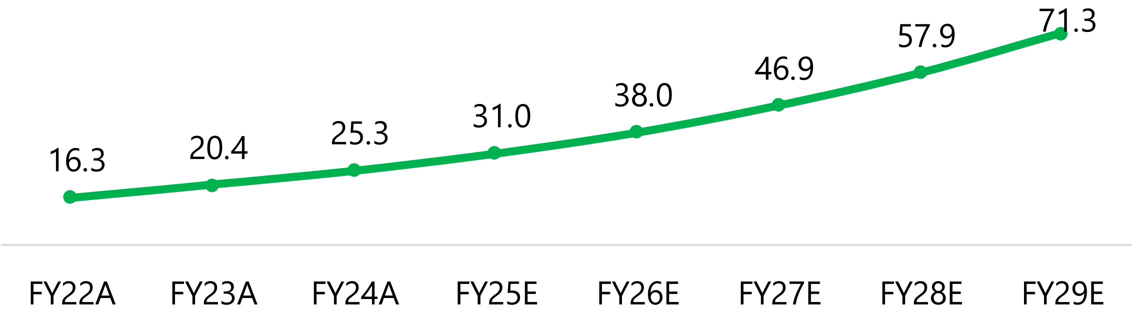
Chinese Mobile Payment Market



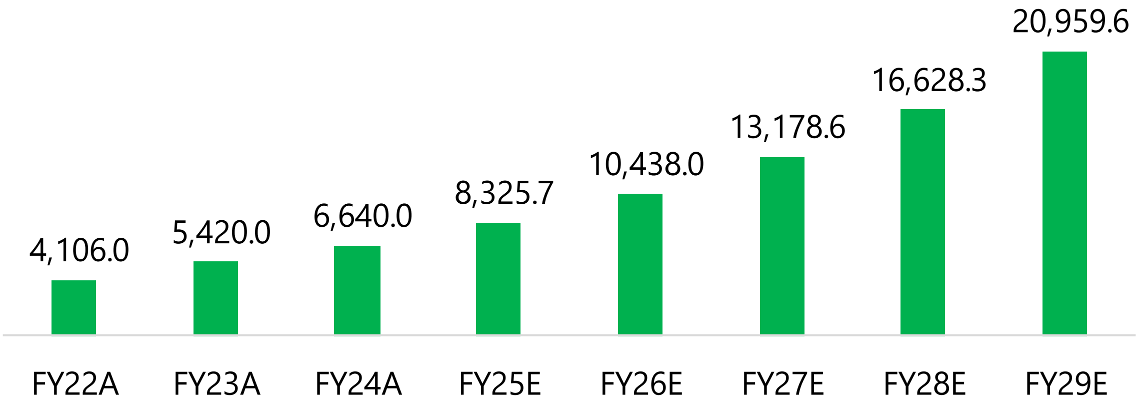
25% Tourism arrivals in SEA are from China, with Grab positioned to capture an **even greater Chinese market share** through strategic app partnerships

…driving Incremental Improvements to Unit Economics

Mobility MTU Growth…



…And Thus Mobility GMV



26% Mobility GMV CAGR (FY24A-FY29E), catalysed by **strong mobility MTU growth**

Source: GO-Globe, Company Filings, Statista, Team Analysis

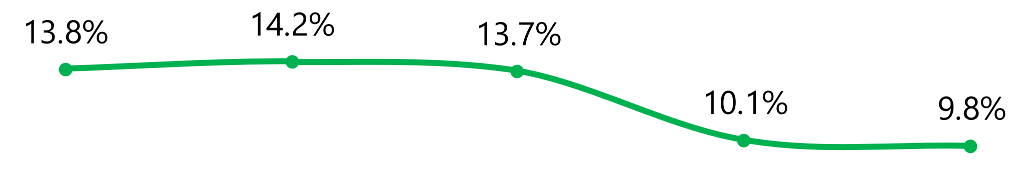
Thesis Two - Efficiency From Pricing Discipline

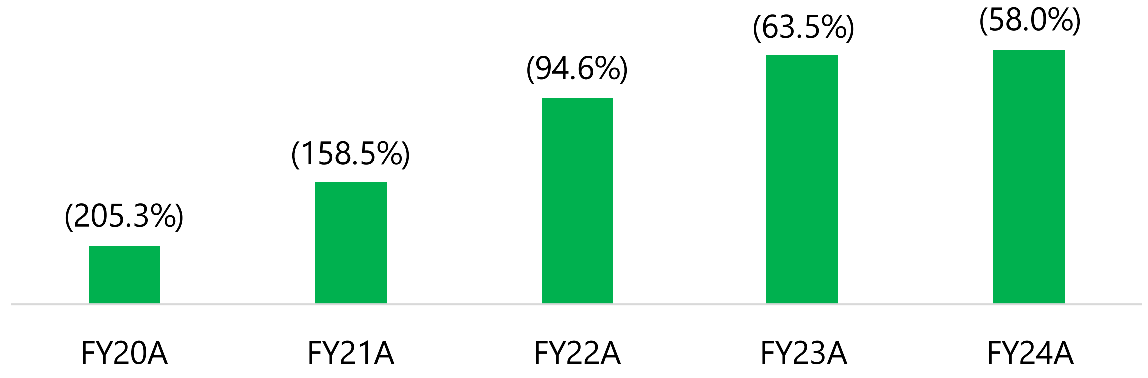
The end of price wars and the start of continued innovation…

Efficiency From Pricing Discipline

Margins that are built to endure, reinforced by structural and competitive tailwinds…

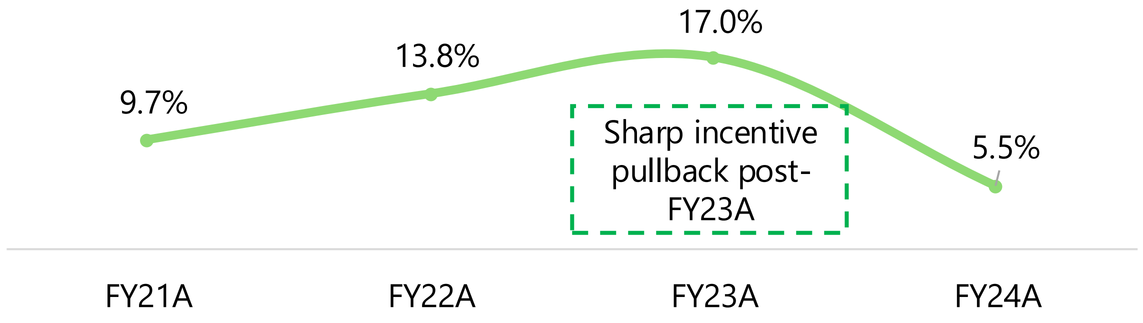
Incentive Spend Has Meaningful Impact on Grab's Margins…

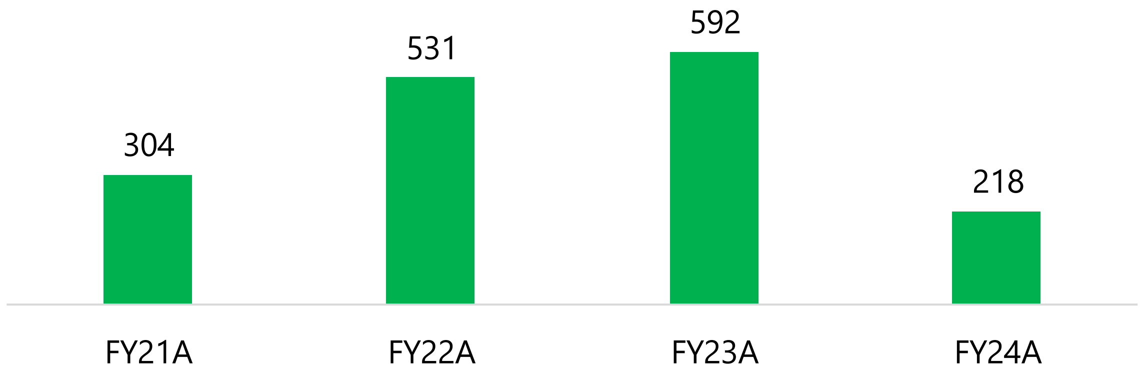




Allowing us to **project future margin expansion**

…With Competitive Intensity Declining…





Shifts away from a **growth at all costs** phase, eliminates one of the primary triggers of past margin volatility

Source: Company Filings, Team Analysis

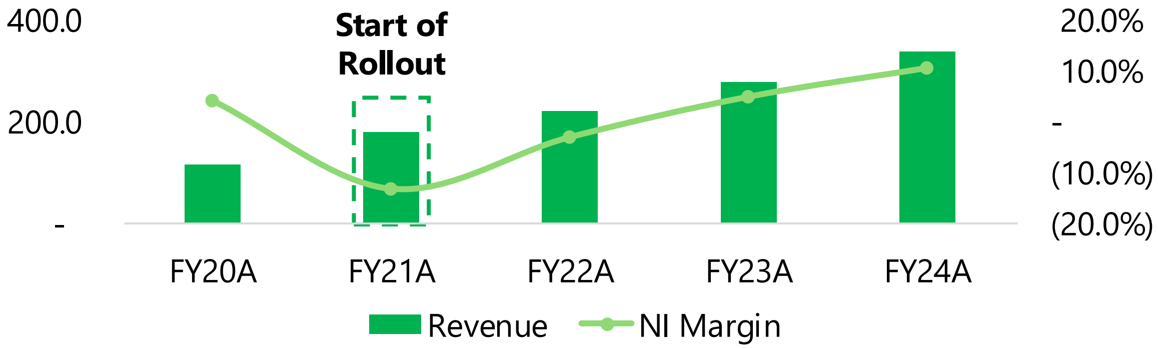
Efficiency From Pricing Discipline

Executing a proven playbook of pricing discipline and automation to structurally lift margins…

…Following in Meituan's Footsteps to Improve the Bottom Line…

Strategic Partnership between… **and investments in…**

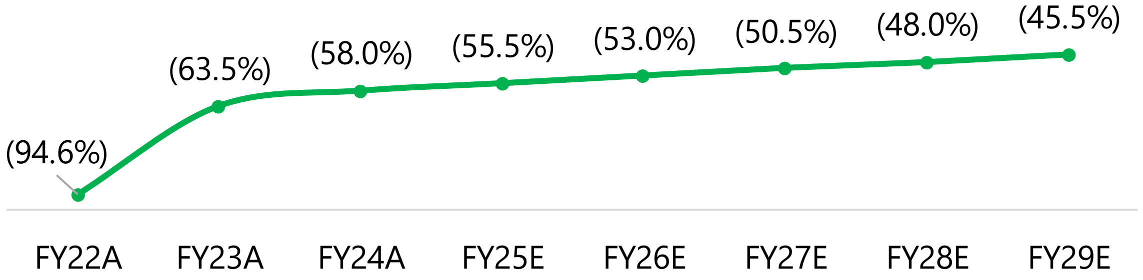
Meituan's Net Income Margin and Revenues (CNY Bns)



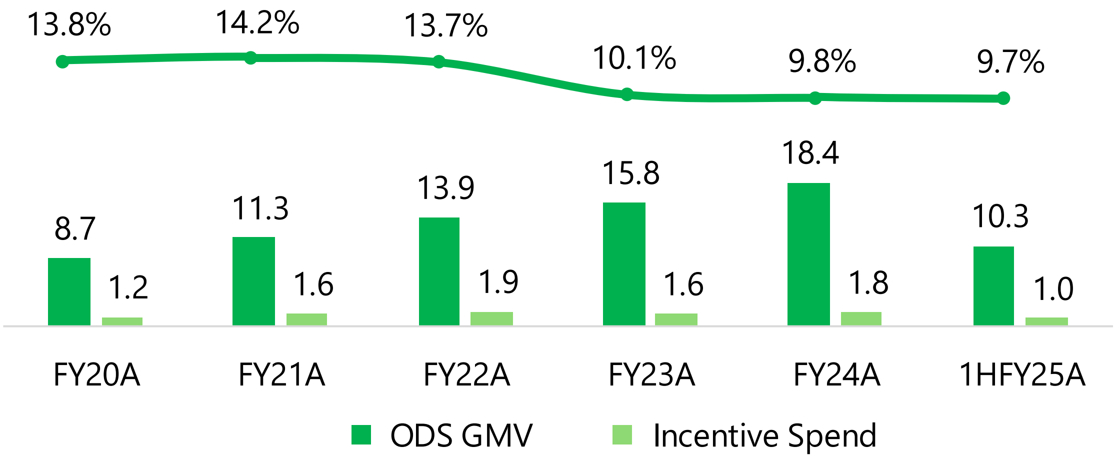
24% **uplift in bottom-line** since Meituan's rollout of AV's and drones

…Reflected in Our Projections Without Compromising on Growth

Cost of Revenues Margin



Grab Incentive Spend to ODS GMV



Robust historical growth despite **reduced incentives** allow us to remain **bullish** in our projections

Source: Grab Website, S&P Capital IQ, Team Analysis

Thesis Three - Mobility Expansion Beyond Competitive Share Gains

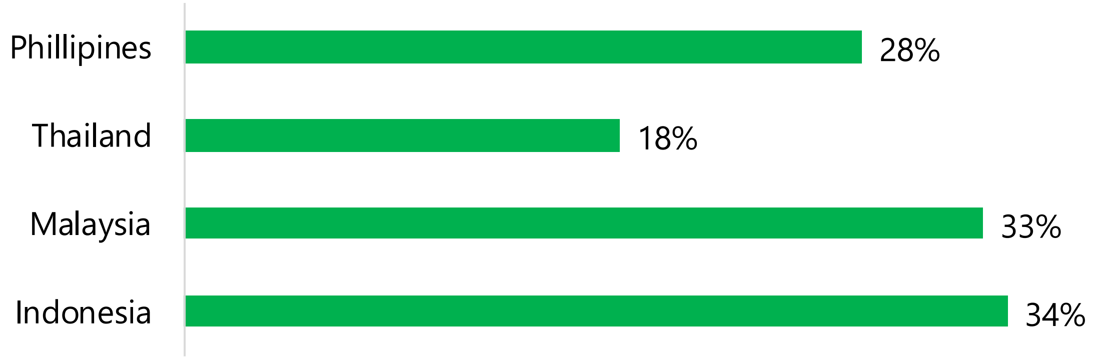
Growth in the ride-hailing industry supports it all…

Mobility Expansion Beyond Competitive Share Gains

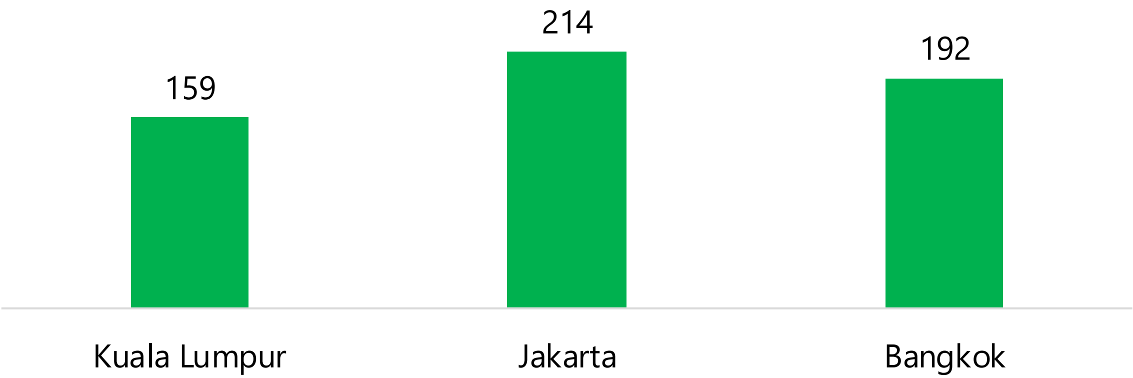
Ride-hailing's rising transport share in SEA amplifies Grab's lead…

Lagging Public Transport and Road Infrastructure…

Poor Consumer Satisfaction With Public Transport in their Area…



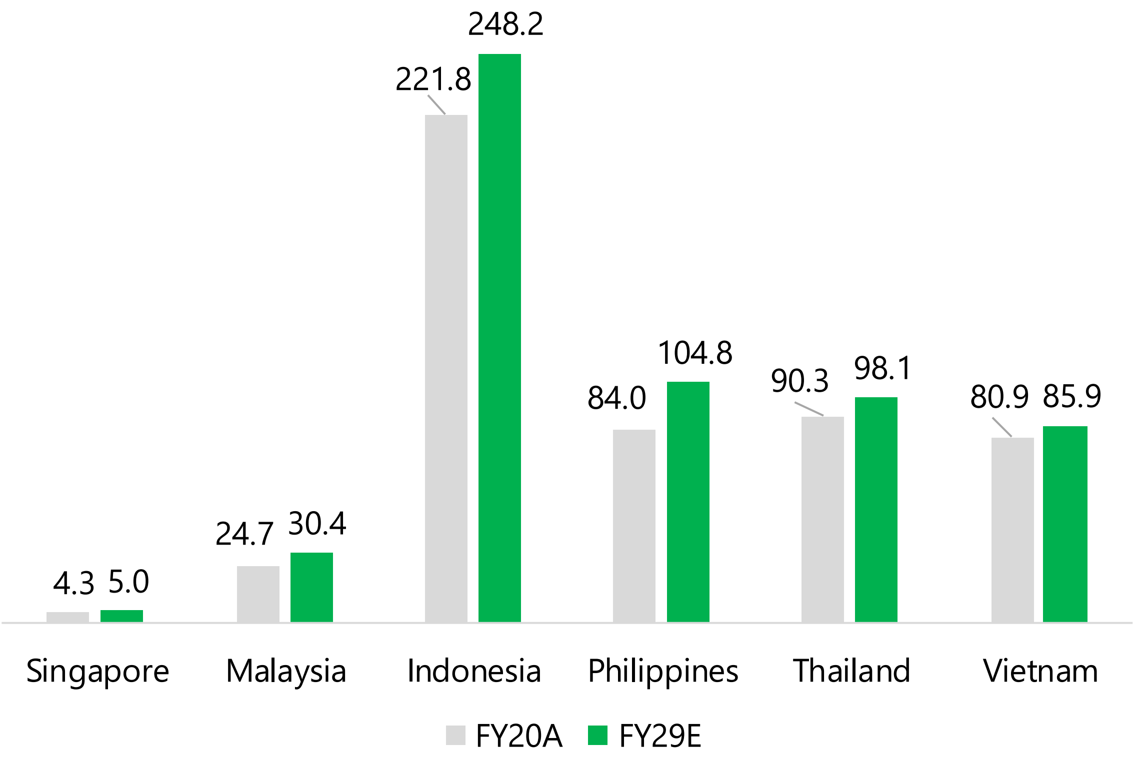
…Alongside Significant Hours Lost to Traffic Yearly in Grab's Key Geographies…



Discouraging consumers from using private or public modes of transport

…Coupled With Rising Affluence…

Number of Middle Class Households (Mns)



66M

uplift in Middle Class Households in Grab's Key Operating Geographies

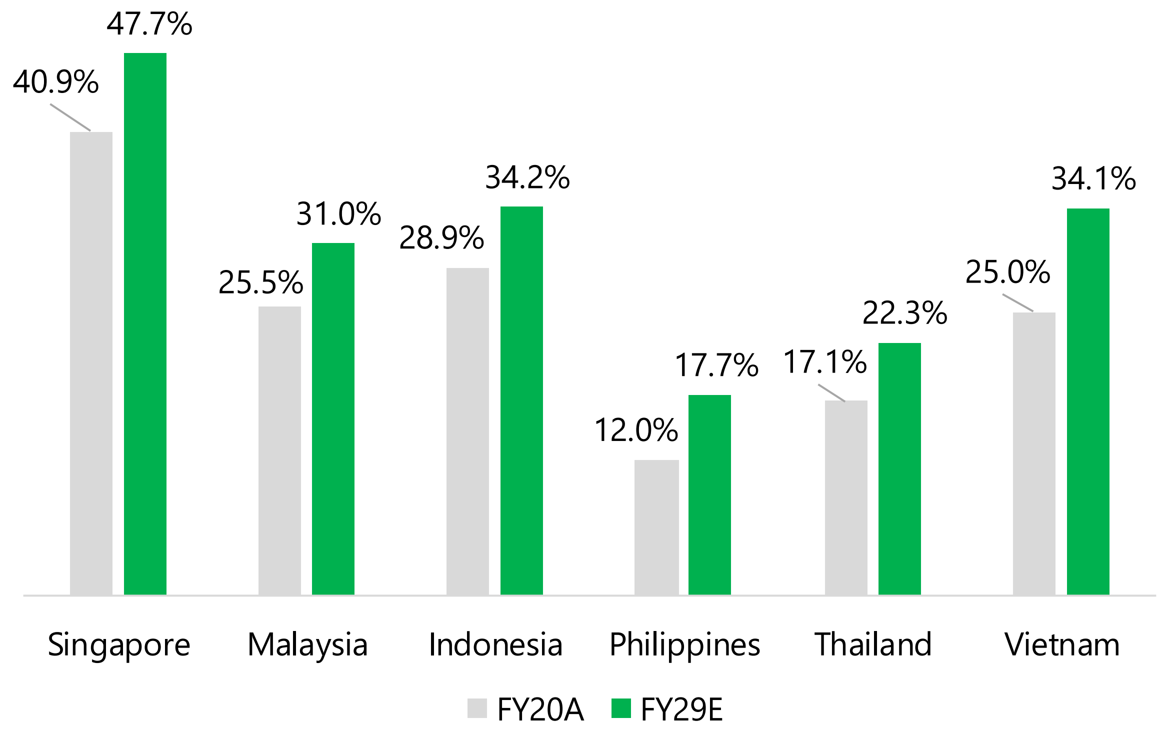
Source: CNA, Euromonitor, Malay Mail, Poskod.sg, Statista

Mobility Expansion Beyond Competitive Share Gains

Greater demand for ride-hailing services drive incremental user growth…

…Pushes Users Towards Ride-Hailing…

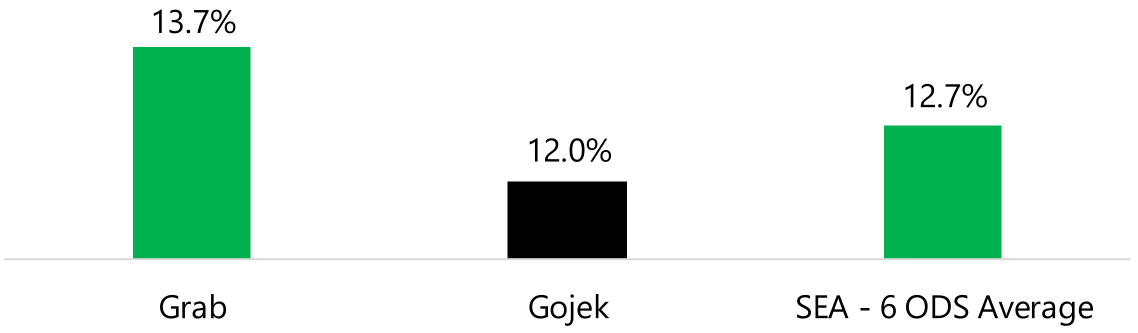
Ride-Hailing Penetration Rates



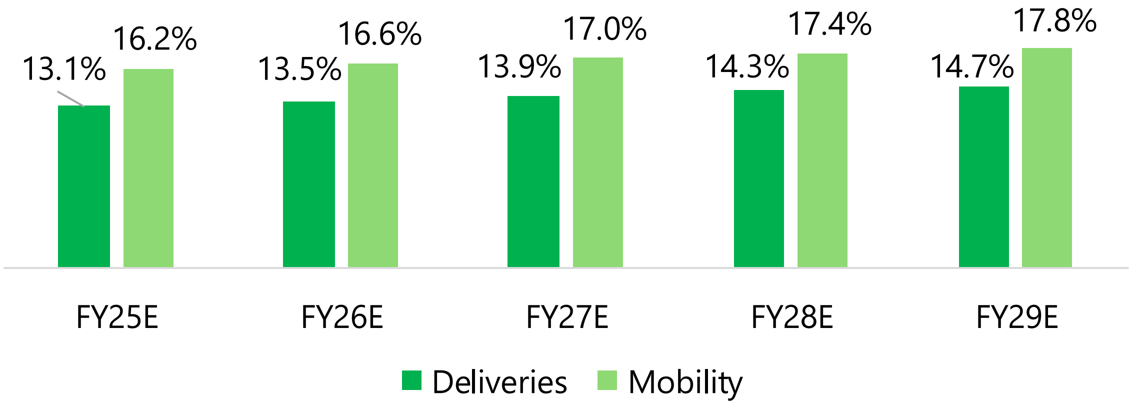
Rising affluence pushes users towards the **more premium service** of ride-hailing

…Which Grab is Best Positioned to Capture

Current Take Rates Comparison



Future Take Rates Expectations



1.6% uplift in projected take rates, allowing Grab to best **capture incremental future demand**

Source: Gojek & Grab Company Filings, Team Analysis, Temasek, Statista

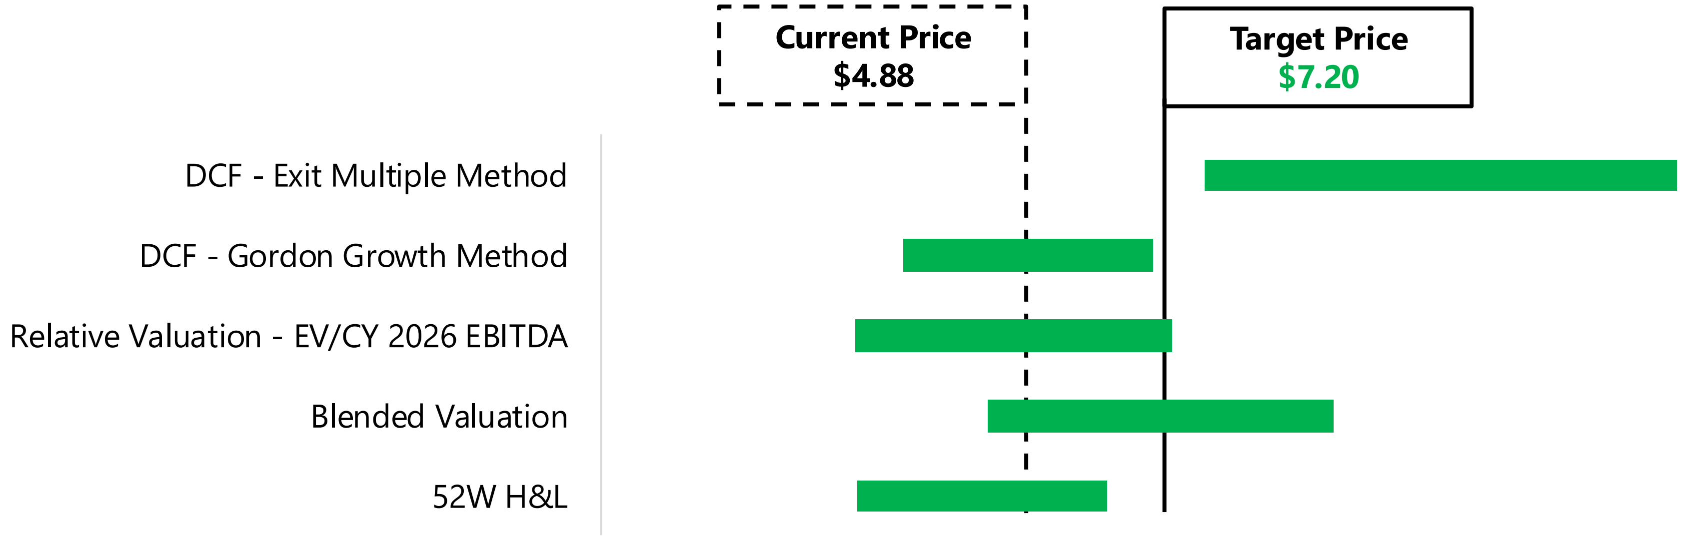
Financial Analysis & Valuations

Soaring with a margin of safety…

Valuation

We Derived a Share Price of $7.20, implying a 47.5% Premium to the Last Close of $4.88.

Our valuation takes a blended approach consisting of a DCF Model (67%) and Relative Valuation (33%)



DCF - GGM

WACC: 10.6%
TGR: 4.0%
Weightage: 33%

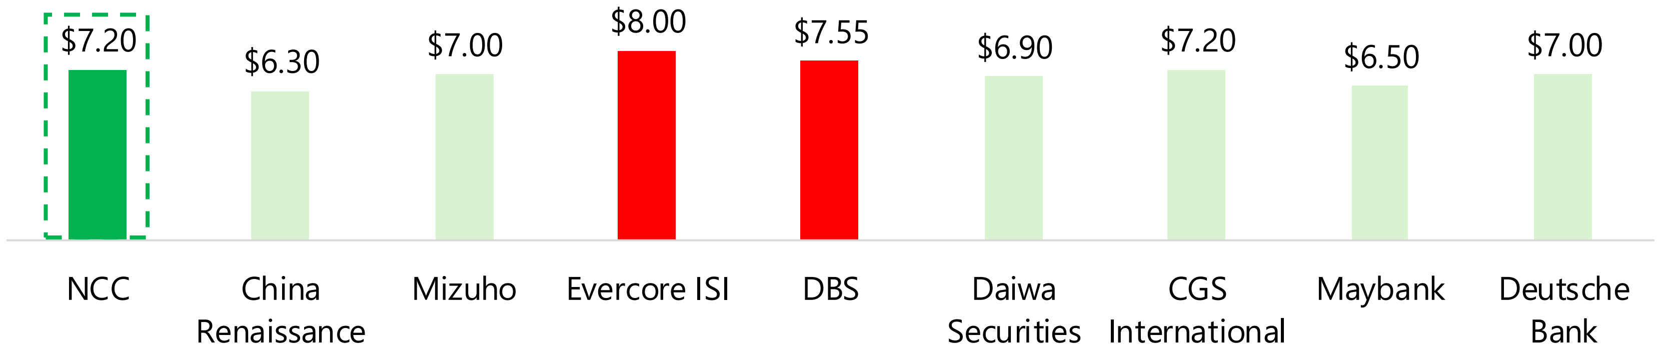
DCF – EMM

WACC: 10.6%
Exit Multiple: 26.9x
Weightage: 33%

Relative Valuation

Regions: SEA
EV/CY+1 EBITDA: 26.9x
Weightage: 33%

Our Target Price Exceeds Street Estimates While Not Being Overly Bullish



Key Model Drivers

Strong Revenue Growth: Capitalising on **industry and macroeconomic** tailwinds to drive topline growth

Margin Expansion: Driven by **cost cutting** efforts through **innovation** and **reduced incentive spending**

Source: Company Filings, S&P Capital IQ, Yahoo Finance, Team Analysis

Valuation

Where We Differ From the Street…

We Believe Consensus is Too Bearish on Grab…

	Cons.	Bull	Base	Bear
5Y Revenue CAGR (%)	21.6%	29.2%	23.7%	18.3%
Gross Margin FY27 (%)	48.9%	50.5%	49.5%	48.5%
EBITDA Margin FY27 (%)	21.0%	26.0%	20.2%	14.5%

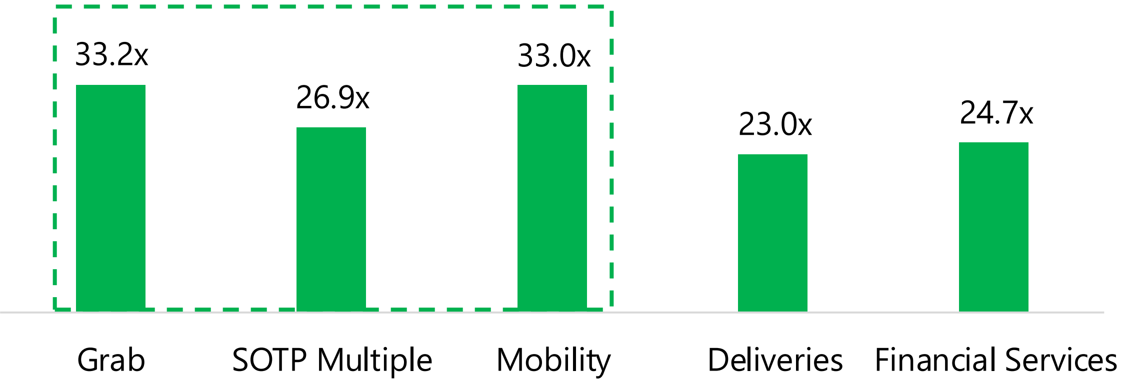
24% revenue CAGR due to **rising tourism spend and ride-hailing growth**

50% gross margin due to **reductions** in **incentive spending and cost cutting investments**

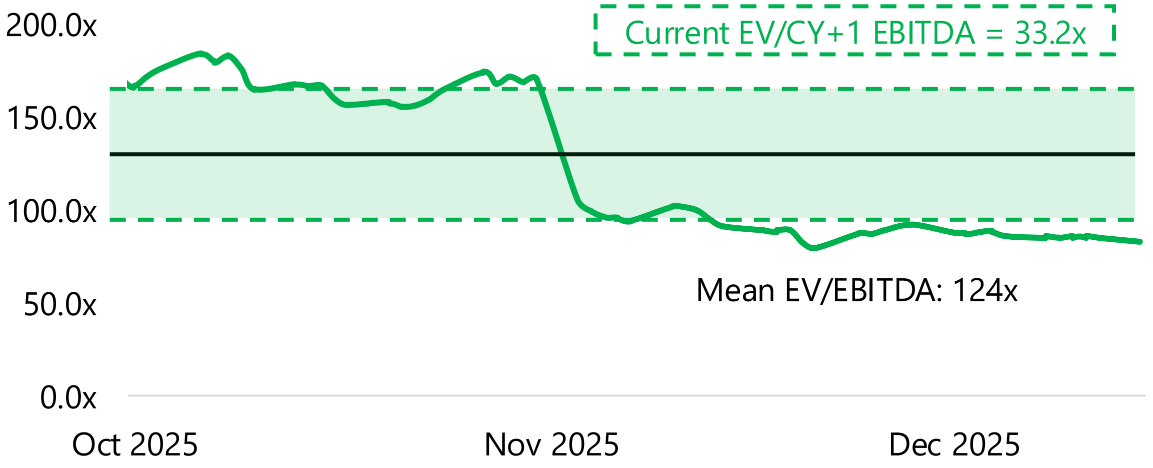
20% EBITDA margin due to **cautious projections** of Financial Services margins

…Resulting in Grab's Mobility Like Multiples

Grab Barely Trades at a Premium to its Mobility Peers…



…While Also Trading Below its Historical EV/EBITDA

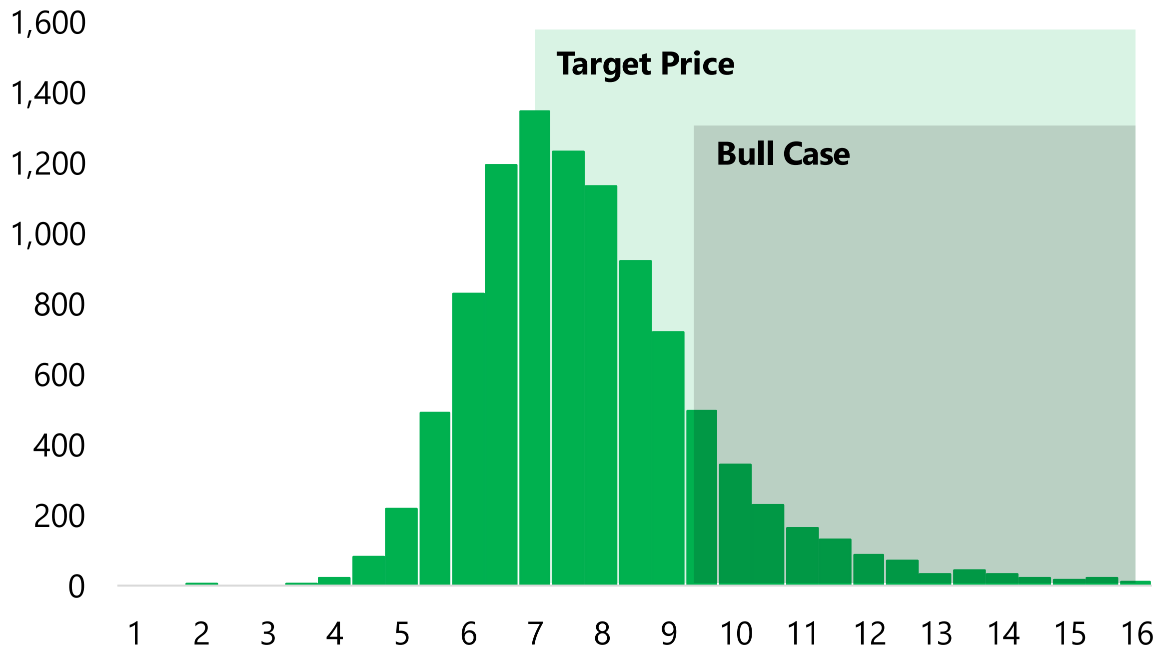


Source: S&P Capital IQ, Team Analysis

Sense-checks to ensure the feasibility of our target price…

Margin of Safety in Our Valuation…

Monte Carlo Simulation Implies Margin of Safety in Our Valuation

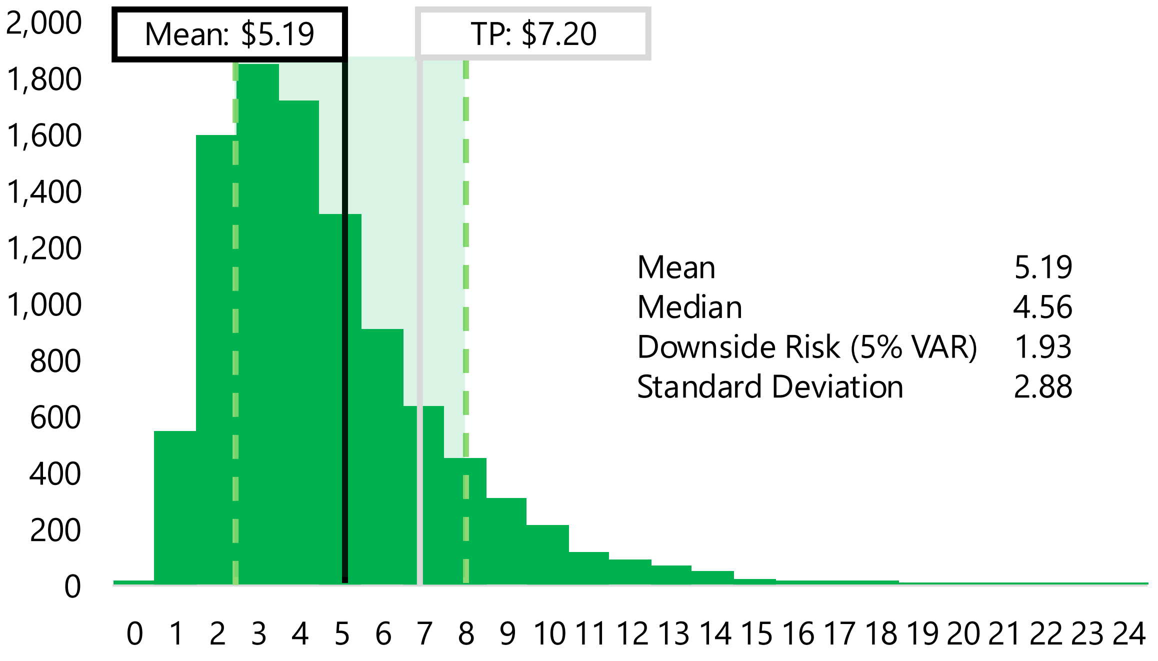


66% out of 10,000 trials, **majority supported** our target price…

17% …of which **supported** our bull case scenario

…Supported by Statistical Analysis

Geometric Brownian Motion Simulation Implies Statistical Feasibility of Our TP



The Geometric Brownian Motion Simulation is not a driver of our target price, but acts as a **sense check** to determine the **technical feasibility** of our projections. With the **target price lying within the upper quartile** of the simulated prices, based off Grab's 1Y historical price action, our target for Grab is **feasible**

Financial Analysis

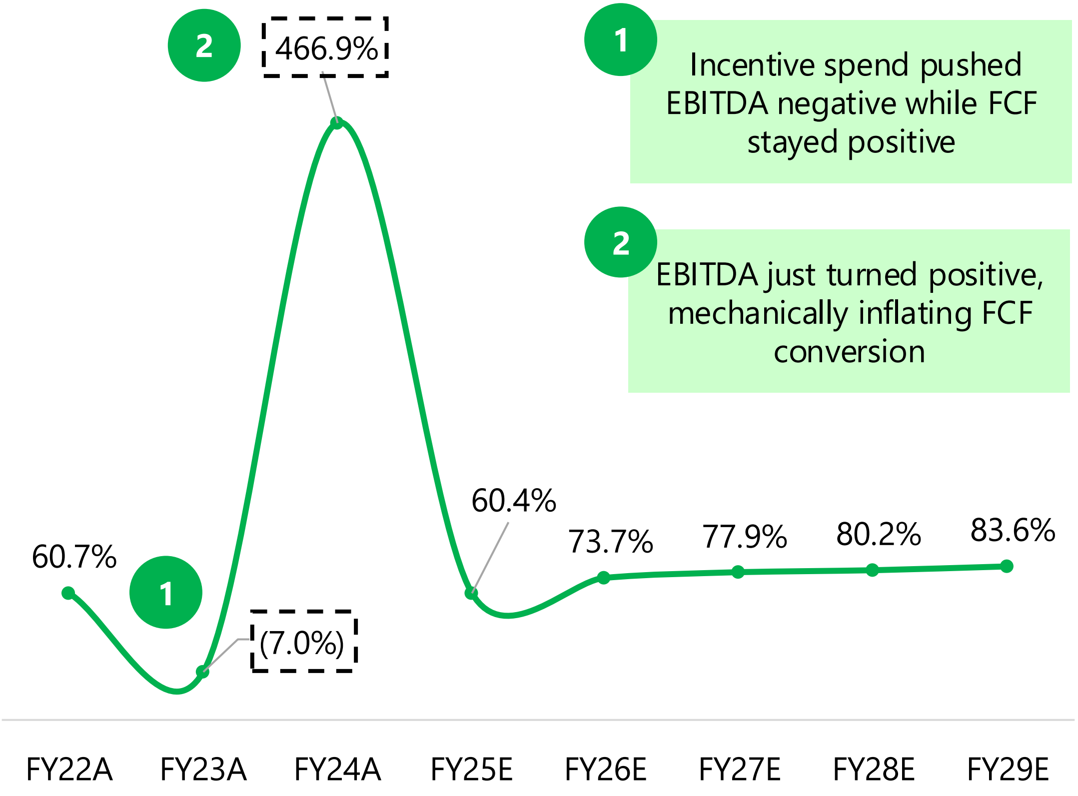
Turning strong operations into tangible shareholder returns…

We Expect Grab to Improve Cash Flow to Shareholders …

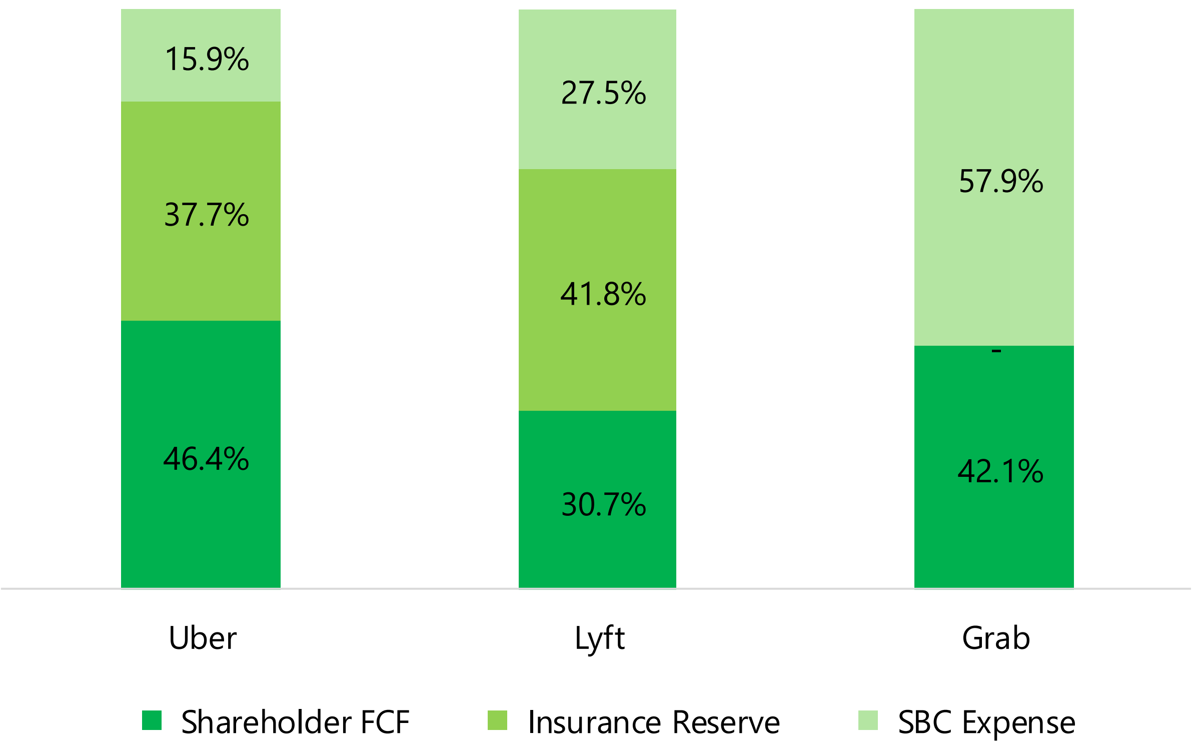
Free Cash Flow Conversion



FCF conversion to normalize and steadily improve, driven by **EBITDA growth, improved working capital efficiency, and disciplined capex**

…Unencumbered By Structural Pressures Facing Competitors

FCF Breakdown: Grab vs Peers



Mandatory insurance reserves tie up cash for Uber and Lyft, structurally **limiting shareholder cash flow growth**, while Grab faces no such requirement

Source: Company Filings, Team Analysis

Risks

Grab's risks are mitigated by scale and ecosystem strength...

	Risks	Mitigation
M1	**Economic slowdowns** threaten weak growth in mobilities and deliveries GMVs	**Affordable tiers, dynamic pricing and disciplined lending** to protect engagement and margins
M2	**Intense competition** forces price-led incentives, pressuring margins	**Promotion wars structurally unlikely** as competition rationalizes and regulation favors disciplined pricing
F1	**Stronger USD** in risk-off environments **pressures** Grab's EMFX cash flows and USD revenues	USD weakness **likely to continue**, reducing FX headwinds and creating attractive hedging opportunities
F2	Increasing political pressure to limit commissions and increase driver benefits will hurt margins	Autonomous adoption reduces human reliance, enabling higher take rates and lower benefit costs

Appendix

Appendix Directory

Appendix A1

Frequently Asked Questions

Back to Directory

Why is Grab's Business Model Volume Driven?

- Most consumers do not make ride-hailing or delivery choices off brand loyalty, and simply use the cheapest alternative.
- Our survey showed the price elasticity of Grab's two main revenue drivers, limiting Grab's pricing power.
- Limited pricing power results in Grab's revenues being heavily dependent on increasing user volumes.

What is Grab's flywheel and why is it important

- Grab's ecosystem drives engagement, with increased usage among drivers and merchants reinforcing platform liquidity
- Mobility, Deliveries and Fintech verticals reinforce each other through cross selling
- Flywheel lowers costs, enabling capital light growth with high incremental returns

Why does tourism improve Grab's margin profile and not just growth?

- Tourists are typically less price sensitive and value convenience and reliability over other groups of consumers
- Tourists also adopt premium services more readily (larger cars, faster bookings) raising the average selling price (ASP), increasing monetisation per user without proportionate incentive spend.

What are the main macroeconomic downside risks to Grab?

- Softening demand for rides, delivery orders and DFS usage in a downturn
- Mobility may shift to affordable alternatives like public transport
- Deliveries can see lower frequencies and trade-down behaviour
- DFS face slower loan growth and higher delinquencies

How does delivery density mechanically improve margins?

- Shorter distances reduce time and cost per delivery, improving unit economics
- Batching increases orders completed per trip, lifting courier utilisation
- Higher delivery density lowers "deadhead" time and stabilises ETAs and reliability

What is "subsidy war" risk and how does it impact valuation?

- If competitors escalate incentives, Grab may need to respond to protect market share
- This lowers take rates and raises promotion costs, compressing margins
- Margin compression impact EBITDA directly
- It also challenges the thesis that margin gains are structural and durable

Appendix A2

Back to Directory

Frequently Asked Questions

How is the impact of tourism not priced in?

- The market is underestimating the impact of improved market penetration within the growing tourist market
- While volume itself is on a recovery, our data shows Chinese tourists are using high-margin services via Alipay integration
- Even if volume growth slows, the value per transaction is higher than pre-COVID

How material is DFS growth to our growth thesis?

- We share the consensus view that Grab's DFS segment will continue to weigh on growth rather than contribute to it
- We estimate FY25E EBITDA at USD 441m, below management guidance, as persistent DFS losses weigh on near-term profitability, in line with our expectations
- DFS is Grab's only critical segment which doesn't have direct user funnels, relying on mobilities and deliveries to drive users towards it

Why do we project increased ride hailing market share?

- Transport Infrastructure in SEA excluding SG remains lacklustre with urban planning skewed toward cars
- Despite investments into public transport infrastructure, last-mile solutions remain lacklustre, based on data, we also see that ride-hailing is heading towards becoming a necessity instead of discretionary spending in transport system
- In SG, the trend is heading away from car ownership, further supporting the structural demand for ride-hailing

Why are we confident that industry-wide incentive spending will moderate even though users are price elastic?

- From our research, competitors such as Gojek and ShopeeFood have reduced incentive spending, indicating that the competitive landscape has shifted from 'growth-at-all-costs' environment to sustainable profits
- Our valuation does not write-off price wars completely, rather we are pricing in a base case of lower incentive intensity market wide, however valuation remains sensitive to price wars as quantified in our risk table

How exposed is Grab to China tourism slowdown or geopolitical shock?

- China is a meaningful upside corridor with Chinese tourists accounting for 25% of all SEA tourists arrivals, a slowdown in in Chinese tourism would pressure tourist GMV/user
- Our thesis is based on tourism flows for the entire SEA and a slowdown in Chinese tourists does not break our thesis
- Intra-region tourism in SEA remains robust with arrivals from within the region accounting for 45% in 2024 (Source: **OAG**).

Why do Grab's investments deserve premiums despite being in pilots?

- Grab's core constraint in its delivery and mobilities verticals are driver supply and labour-related policy risk, we are not underwriting full AV rollout today but assigning value to such initiatives as a hedge against these risks
- Even limited deployment of AVs or drones can reduce Grab's dependence on driver supply and incentive pressure
- Proof-of-concept from peers such as Meituan have successfully implemented autonomous solutions with material effects on valuation
- Grab is early in this space with a regulatory headstart through current pilots

Appendix B2 | Company Analysis

Grab

Back to Directory

SWOT Analysis	
Strengths	Grab **leads** SEA's ride-hailing and food delivery markets, with its **integrated** super-app driving **strong user stickiness** and **cross-segment monetisation**. Localised operations deep partnerships and **high switching costs** support rapid scaling and durable competitive advantages, while platform synergies and AI-driven pricing and route optimisation continue to **improve unit economics**, underpinning EBITDA profitability achieved in 2024.
Weaknesses	Despite efficiency gains, Grab's delivery segment faces **margin pressure** due to competitive pricing and partner incentives. Its gig-worker dependent model exposes it to **regulatory and reputational risks** related to labour classification, benefits and income stability. Grab is also concentrated in SEA, making it **vulnerable** to regional economic downturns or policy shifts.
Opportunities	GrabFin has emerged as a **growth engine**, reaching 4.5 million **previously unbanked users**. Scaling this ecosystem across SEA's approximately 290 million unbanked adults offers **massive long-term potential**. Advertising is projected to rise from 1.7% to about 3-4% of GMV according to Bloomberg Intelligence. AI and predictive analytics can also enhance **scalability** and **efficiency**. Finally, Grab's carbon reporting ad electrification roadmap align with ASEAN Green Finance Frameworks, opening access to ESG-linked credit lines and investor capital.
Threats	**Improving** public transport **connectivity and micromobility** infrastructure could structurally reduce ride-hailing penetration in key urban markets over the medium term. **Inflation**, currency depreciation and weak consumer demand in emerging Southeast Asian economies can reduce spending on mobility and delivery services. Furthermore, as Grab scales its fintech and advertising offerings, it faces **increased exposure to data security, cyber-risk and digital trust issues,** which could weigh on user confidence and invite heightened regulatory scrutiny

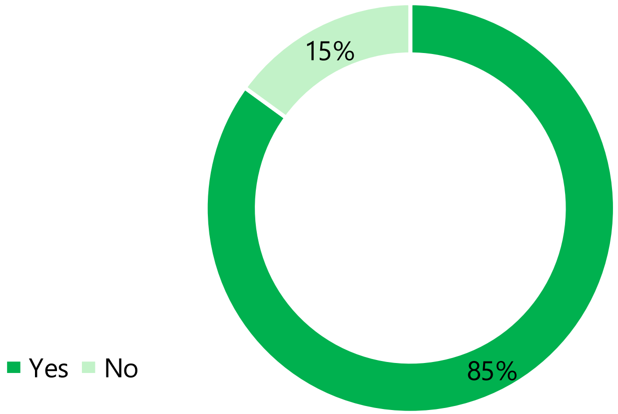
Appendix B3 | Primary Research

[Back to Directory]

Survey conducted for preferences and understanding Grab's fundamental business model…

Exclusive Interview with Grab Executive

Survey Question: If Grab were more expensive than other apps for the same service (ride-hailing or food delivery), would you still choose Grab?



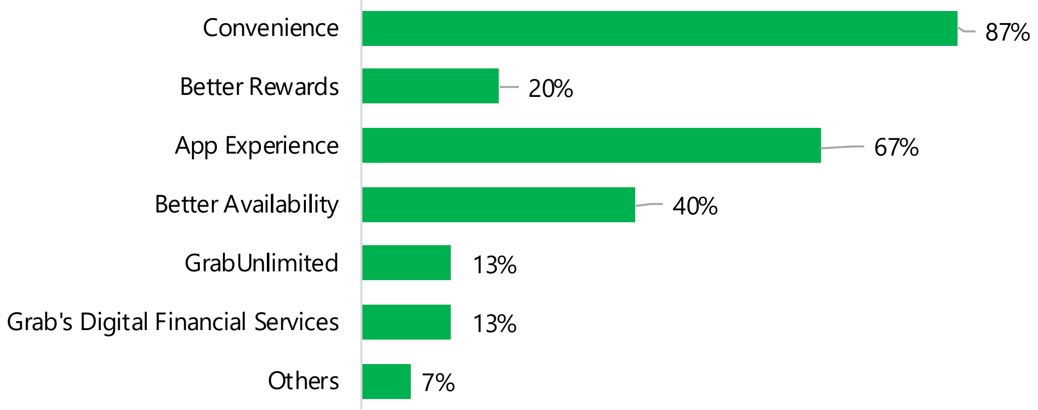
85% of respondents would not choose Grab, if Grab's services were more expensive

Commentary: The results of the primary survey show that Grab's services remain extremely price elastic across its key verticals of deliveries and mobilities, this leaves Grab vulnerable to a re-emergence of price wars started by well-funded competitors.

Business Insights: This reinforces the stand that Grab's moat is not through charging higher prices. Grab wins by using scale and efficiency through technology to keep costs low and maintaining margins while maintaining competitive prices.

Primary Research On Consumer Preferences

Survey Question: If Grab were more expensive than other apps for the same service (ride-hailing or food delivery), would you still choose Grab?



Commentary: Among the loyal 15%, the biggest reasons for staying with Grab were convenience, app experience and better availability. This shows that Grab's stickiness comes from being the default habit and better UI. Better availability comes from having a larger network of driver- and merchant-partners, leading to lower waiting times and better reliability.

Business Insights: Grab can lean into this loyal segment through **membership and rewards through GrabUnlimited** to lock in repeat usage, and **premium reliability** that keeps Grab the default choice even at a price premium.

Appendix B4 | Executive Perspectives

Interview with company expert to better understand Grab's DFS segment…

Back to Directory

Executive Perspectives – Jenn Ong, Head of Retail Banking at GXS Bank

Jenn Ong, Head of Retail Banking at GXS Bank

Q1: How does the Grab/ GXS partnership benefit Grab?

A: GXS Bank's financial performance is shaped by several key revenue and cost drivers. On the revenue side, growth is primarily supported by **net interest margins and loan expansion**, with further upside from extending its reach into developing markets by **leveraging Grab's ecosystem** to acquire and serve new customer segments. Costs, meanwhile, stem largely from salaries, system usage, and rental expenses, though the bank has entered a strong cost-reduction phase. Notably, its AI-driven automation, such as recently introduced voice bots, has enabled substantial efficiency gains, **handling over 2,000 calls for collections compared to roughly 200 calls per human agent**, effectively generating revenue uplift at minimal incremental cost. While credit losses may arise from loan defaults, these operational and technological efficiencies help GXS scale more sustainably.

Q2: What are some major revenue & cost drivers for GXS?

A: GXS Bank's strategic value is enhanced by its deep integration within Grab's super-app ecosystem. Leveraging Grab's large base of consumers and merchants, GXS accesses rich transaction and behavioral data to improve risk assessment and price credit more efficiently. Grab's merchant and driver network further expands GXS's reach into working-capital lending, particularly in developing markets. Over time, GXS can also support internal financing for Grab's M&A activity, reducing reliance on external banks and lowering transaction costs. With Grab holding a **60% controlling stake**, value creation at GXS ultimately reinforces the economics of the broader Grab ecosystem.

Source: Team Analysis

Appendix B5 | Strategic Partnerships

Back to Directory

Grab has made numerous strategic partnerships…

Autonomous Vehicles Partnerships

Grab and May Mobility announced a multi-year strategic partnership under which Grab has made an equity investment in May Mobility to support the expansion of the AV company's technology into Southeast Asia. Grab made this partnership with intentions of expediting Grab's AV ambitions, with May Mobility's AV driving software being **integrated into Grab's fleet management, vehicle matching and routing systems**.

Grab signed 4 Memorandums of Understandings with Autonomous A2Z, Motional, WeRide and Zelos to evaluate how autonomous vehicle could be deployed in Southeast Asia across mobility and delivery use cases, including shuttle buses, passenger cars and delivery robots. The partnerships focuses on **three scaling questions**. First, this partnership aims to address **safety issues** such as how AVs can reduce accidents and improve traffic outcomes. Second is **workforce transition**. The partnership aims to evaluate how driver- and delivery-partners can upskill into new AV-related roles as the industry develops. Lastly, this partnerships aims to assess the **cost structure and operating model** needed for AV deployments in Southeast Asia to scale. This pilot provides a stellar opportunity to evaluate the best practices and economic viability of AVs in Southeast Asia.

Drone Partnerships

Grab has launched a three-month drone food delivery pilot in Singapore's Tanjong Rhu neighbourhood in a partnership with ST Engineering's Unmanned Air Systems. The pilot targets a specific bottleneck of the Kallang River where detours slow deliveries. The pilot is using a hybrid model with both drones and delivery-partners involved, where drones are deployed to complete 'difficult' segments of the route with delivery-partners completing the last mile. This pilot shows a real-world use case for drones and how they can help Grab and their delivery-partners **overcome geographical constraints** to reduce late deliveries, lift customer satisfaction and improve platform stickiness in dense urban pockets where congestion creates inefficiencies. This pilot provides a valuable opportunity for Grab to adopt similar situations in other areas in Southeast Asia, providing a scalable and impactful solution for Grab in the labour-intensive verticals of deliveries and mobilities.

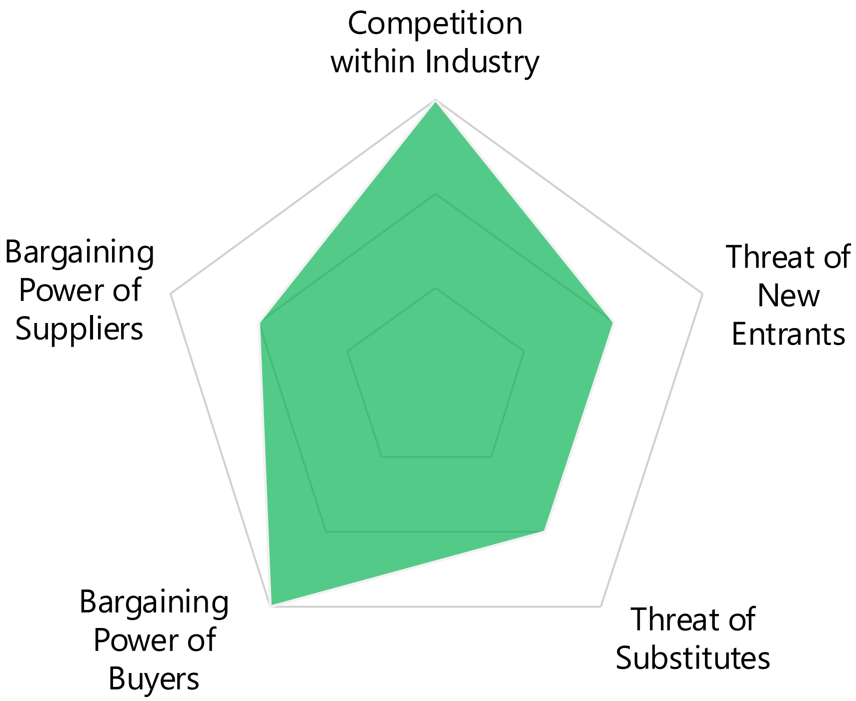
Appendix C6 | Competitive Positioning

Back to Directory

Porter's Five Forces (Mobility & Delivery Segments)



Threat of Substitutes – Moderate: Continued improvements in public transport connectivity and expanding micromobility infrastructure could structurally reduce reliance on ride-hailing, moderating long-term growth across the mobility sector

Threat of New Entrants – Moderate: Incumbents benefit from scale-driven cost efficiencies and strong network effects, improving liquidity and service quality. While per-transaction switching costs are low, ecosystem-level stickiness is rising through loyalty, payments and service integration, alongside high capital requirements for platform development

Competition Within Industry – High: SEA's mobility and delivery markets remain highly competitive, as frequent incentives, multi-homing and transparent pricing intensify fare-based competition

Bargaining Power of Suppliers – Moderate: Drivers or fleet owners can exert bargaining power, especially in tight labour markets or in regions with high turnover. Vehicle manufacturers or maintenance service providers can negotiate higher costs for fleets or equipment

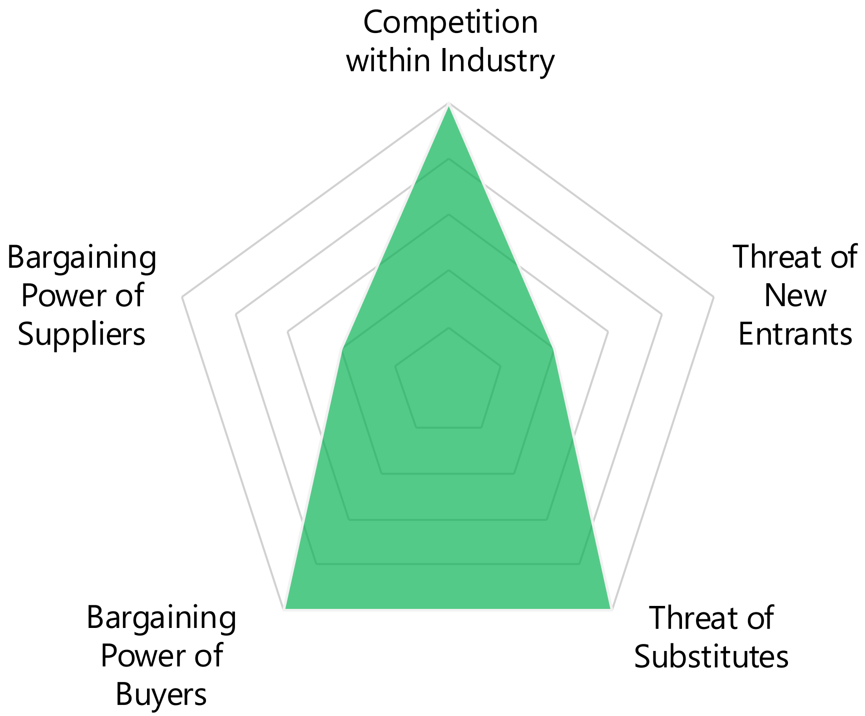
Bargaining Power of Buyers – High: Customers can easily switch platforms due to low switching costs. Furthermore, price sensitive users can drive down fares, squeezing margins

Source: Team Analysis

Appendix C7 | Competitive Positioning

Back to Directory

Porter's Five Forces (Digital Banking & Payments Solutions)



Threat of Substitutes – Moderate: Substitution risk remains high, as the rapid growth of digital banks and wide availability of alternative payment and credit options increase competitive pressure

Threat of New Entrants – Low: Regulatory and licensing complexity create high entry barriers, while scale-driven cost advantages, deep merchant networks and consumer trust reinforce the stickiness of incumbent payment platforms despite low technical switching costs

Competition Within Industry – High: Competition spans digital banks, e-wallets, BNPL providers, consumer finance firms and super-apps, with low switching costs, limited differentiation and intense rivalry driven by pricing, fees and rewards

Bargaining Power of Suppliers – Low: Cloud and software infrastructure has become increasingly commoditised, rendering providers largely interchangeable and constraining their pricing power

Bargaining Power of Buyers – High: Buyer power remains high, as consumers and merchants can easily switch between payment platforms and are highly sensitive to pricing and MDR fees

Source: Team Analysis

Appendix C8 | Competitive Positioning

Back to Directory

Grab vs Peers (Mobility & Deliveries, Digital Banking & Payments Solutions)

Mobility & Deliveries

Bargaining Power of Buyers: On deliveries, while the merchant network size of GrabFood is broadly comparable to competitors like Deliveroo and Foodpanda, Grab's broader ecosystem across rides, payments, and other services allows it to offer rewards and incentives that subsidize consumption across multiple verticals, grabbing the lion's share of the on-demand service market. In contrast, delivery-focused peers are limited to food delivery, reducing their ability to drive cross-service engagement and stickiness

Threat of New Entrants: Grab's broader regional footprint and larger user base across SEA deliver superior economies of scale and stronger demand-side network effects than more nationally focused competitors. Its integrated ecosystem and stronger cash position also support richer loyalty programmes, further increasing user stickiness and switching costs

Threat of Substitutes: Grab's exposure to markets with weaker public transport, combined with its multi-vertical super-app model, reduces the threat of substitutes more effectively than peers. By integrating mobility with food delivery, payments and rewards, Grab retains users within its ecosystem even when they multi-home. Its scale also delivers superior reliability, coverage and shorter wait times, raising the convenience threshold substitutes must meet and lowering sustained switching risk

Digital Banking & Payments Solutions

Threat of Substitutes: Grab mitigates new entrant risk by leveraging ecosystem synergies and data advantages, embedding GrabPay and GXS Bank into high-frequency use cases like rides and deliveries. This positions DFS as a default option rather than a standalone platform, while expanded merchant acceptance and strategic partnerships to secure scarce digital bank licences create high entry barriers for players lacking comparable scale, engagement and regulatory reach

Threat of Substitutes: Grab focuses on making its financial services cheaper and more rewarding than alternatives by bundling payments, rewards and credit within its super-app through GrabRewards, subscriptions and Saver deals, keeping users transacting inside the ecosystem. For merchants and drivers, Grab integrates instant payouts, business loans and insurance alongside payments, increasing friction to switch to standalone solutions. This full-suite proposition reduces the appeal of single-product substitutes, an advantage amplified in SEA where large underbanked populations make embedded financial services especially compelling

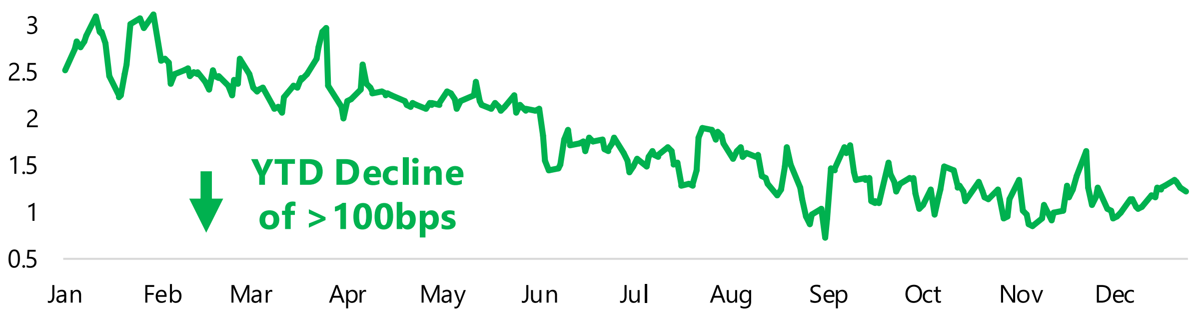
Appendix C15 | Overall Macroeconomic Drivers

Back to Directory

A positive macroeconomic outlook…

Singapore's interest rates expected to fall…

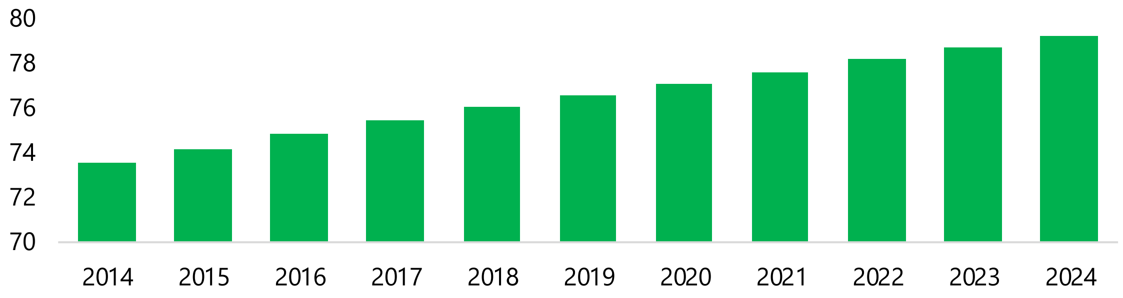
Secured Overnight Financing Rate (SORA)



With 2026 GDP growth revised up to 2.3% (from 1.9%) and inflation steady at 1.5% along with the resumption of the Fed's easing cycle is expected to push Singapore's benchmark rate (SORA) lower, reducing financing costs for individuals

…with Malaysia's favourable urbanisation…

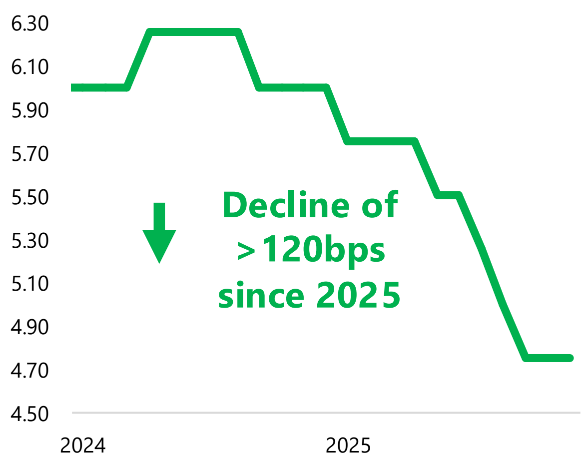
Malaysia's Urbanisation Rates



Malaysia's urbanisation supports Grab's growth by concentrating demand in dense urban centres, where stronger network effects drive sustained usage across mobility, delivery and fintech services.

…along with Indonesia…

Bank of Indonesia Policy Rates



Indonesia's interest rates are biased lower as easing inflation and a stabilising rupiah give Bank Indonesia room to pivot toward a more accommodative policy stance.

Which gives rise to…

Lower Interest Payments and **Higher Disposable Income** to **spend** on Grab service

…and Thailand likely to cut amid subdued inflation

Strengthening USD/THB

Strengthening of THB leads to lower imported inflation, leaving the BOT with more room to cut rates due to subdued inflation

Which gives rise to…

Lower Interest Payments and **Higher Disposable Income** to **spend** on Grab service

Source: Malaysia, World Bank, CEIC, MAS, Investing.com

Appendix D1 | Thesis Analysis (Thesis 1)

Back to Directory

Differing from the Street…

Street View	Variant View
Tourism is a cyclical contributor to revenue growth but not a structural reason to re-rate margins or long-term growth	Tourism rates are normalising but growing steadily, less incentives and promotions are needed to convince them to use Grab's services
Tourism is a volume tailwind but it is more of a complement to other structural drivers	SEA tourism is expected to grow robustly over FY25E-FY29E. Poor public transport networks further nudge tourists towards ride-hailing
Only views tourists using Grab's services for travel related use cases	Tourists that have used Grab's services are likely to continue to use the Grab app when travelling in SEA

Source: Team Analysis, Bloomberg

Appendix D2 | Thesis Analysis (Thesis 2)

Back to Directory

Differing from the Street…

Street View		Variant View
Maybank	Cautious on forward margins as heightened competition may weigh on pricing power and profitability	Promotion Wars are less likely to return as SEA food delivery platforms have exited the growth-at-all cost phase
广发证券 GF SECURITIES	Consumer incentives are expected to remain stable as a percentage of GMV over time	We expect consumer incentives to decrease with competition rationalising and the regulatory and industry environment now favouring disciplined pricing
China Renaissance 华兴资本	View incentives as a swing factor that could meaningfully constrain earnings upside	Even if this happens, Grab's investments into autonomous solutions will allow meaningful reduction in cost of sales, achieving greater bottom line growth

NCC CAPITAL

Source: Team Analysis, Bloomberg

Appendix D3 | Thesis Analysis (Thesis 3)

Grab

Back to Directory

Differing from the Street…

	Street View	Variant View
广发证券 GF SECURITIES	Volume gains are due to improved service reliability and supply availability	Although it is a factor, we view the expansion of ride-hailing's market share in SEA as a greater driver for volume growth
Deutsche Bank	Better supply-demand matching is the main driver of volume growth	Similarly, ride-hailing's increasing market share, boosted by SEA's rising middle class is a greater driver for volume growth
J.P.Morgan	Links trip volumes growth to ecosystem effects and cross-vertical usage	As ride-hailing captures a growing share of SEA's transport spend, Grab captures volume by default

NCC CAPITAL

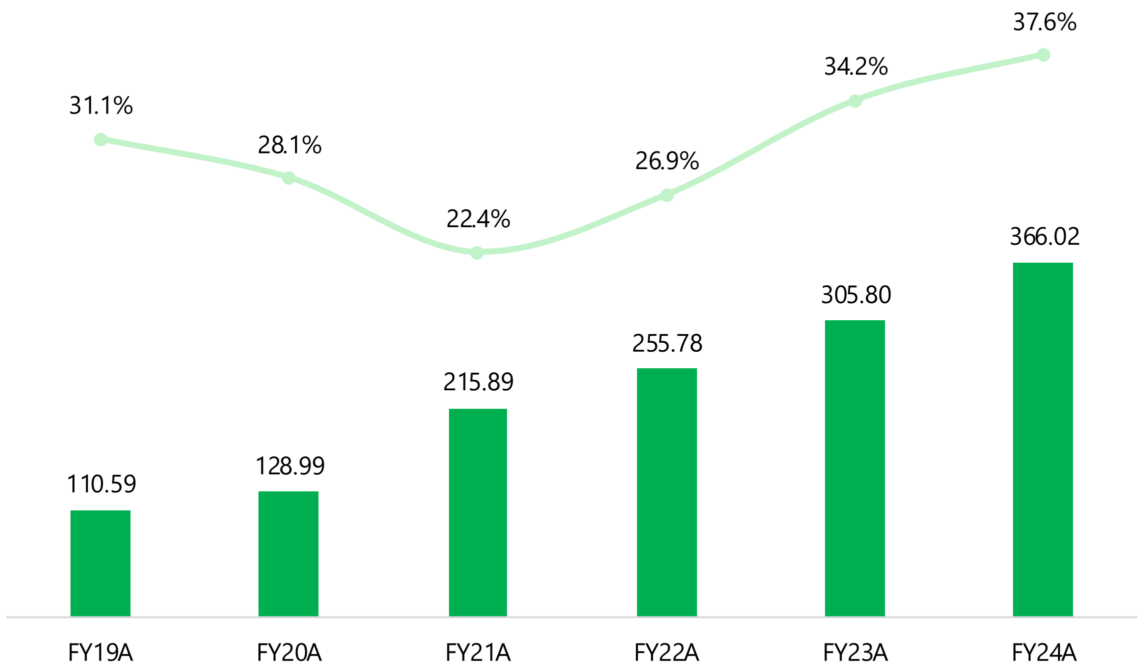
Appendix D4 | Margin Defensibility

Back to Directory

Benchmarking Grab's Investments Against Meituans…

Investments That Yield Results…

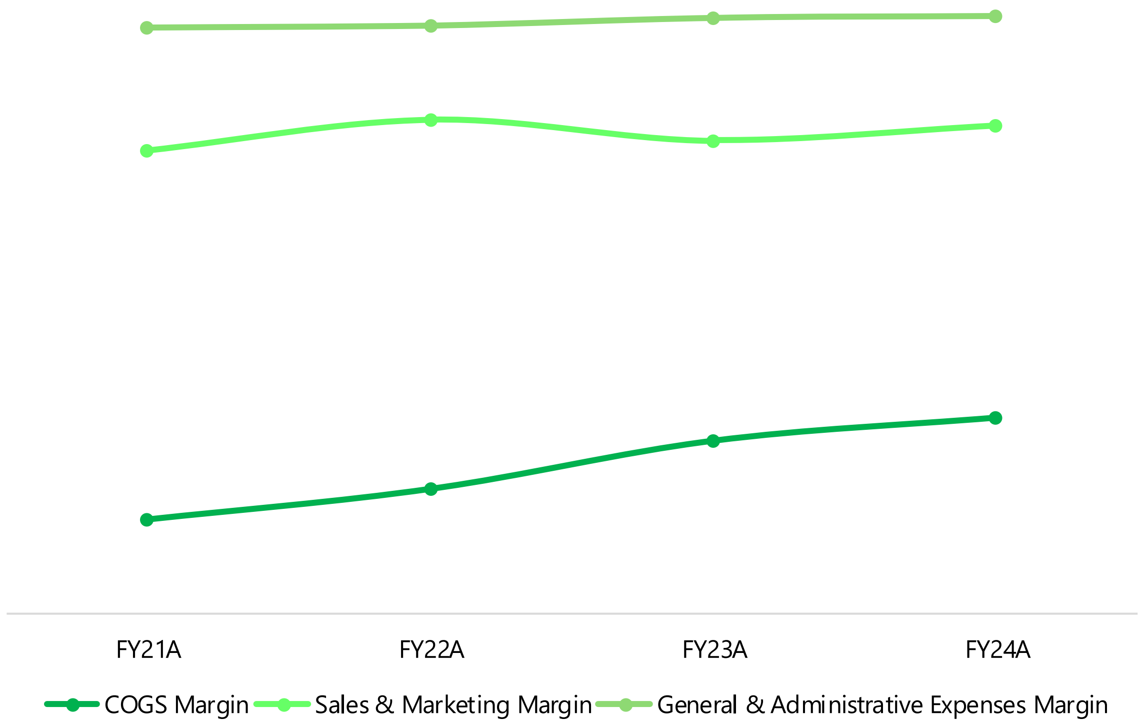
Revenue (CNY Bns) vs Operating Margin (%)



The rollout of Autonomous Vehicles and other investments have structurally lowered Meituan's cost base and enhanced unit-cost efficiency at scale

Sanity Check Against Our Projections…

Meituan's Improving Operating Expenses



Meituan's Margins have all improved significantly in the key segments which we have forecasted margin expansion for Grab

Source: S&P Capital IQ, Team Analysis

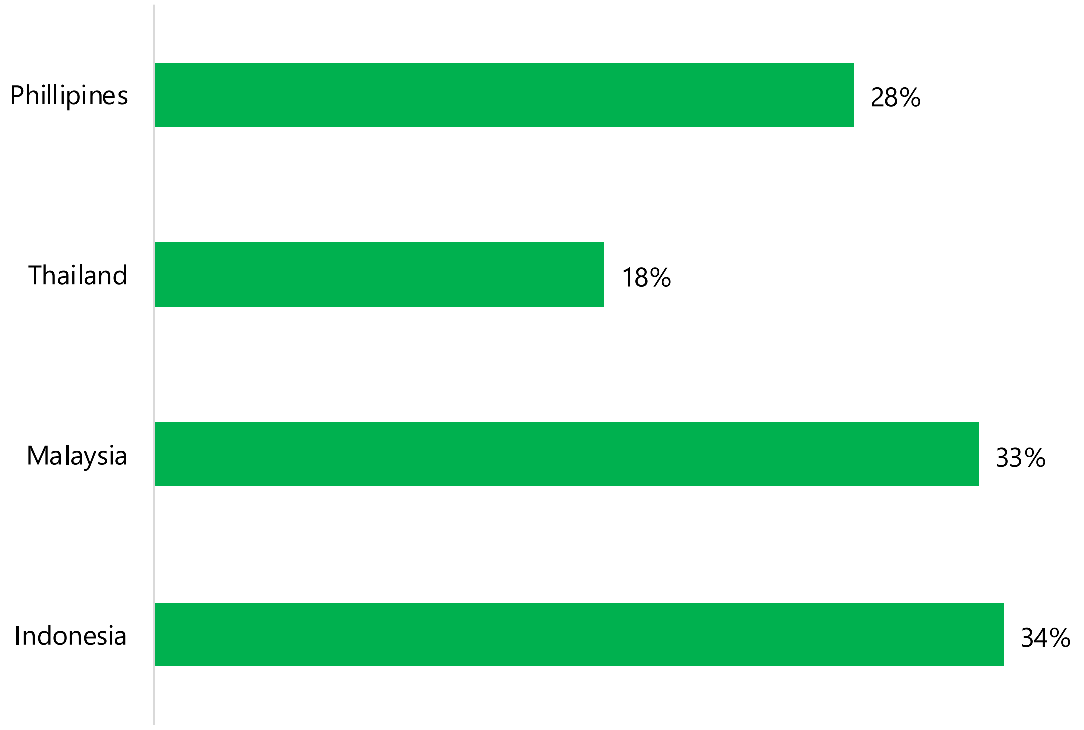
Appendix D5 | Switching to Ride-Hailing

Back to Directory

An Industry Set to Benefit From Structural Tailwinds…

Poor Consumer Satisfaction With Existing Infrastructure…

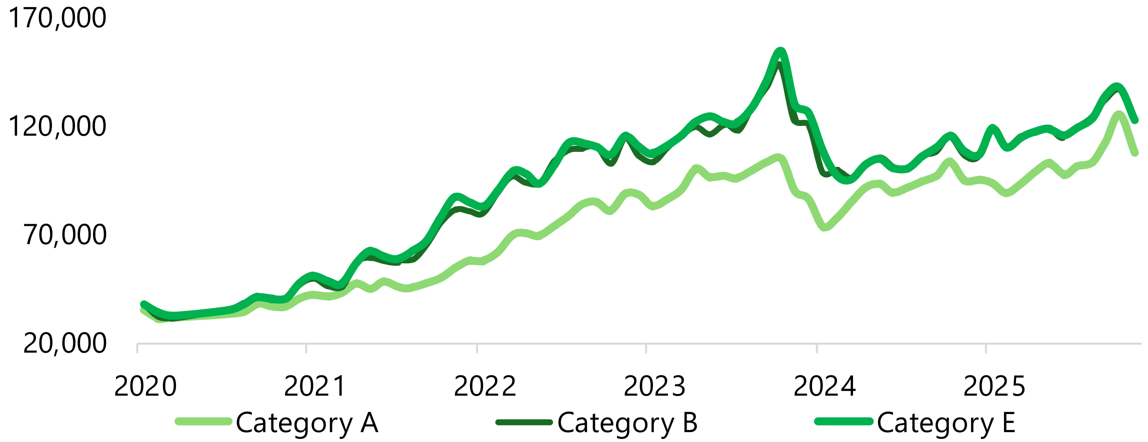
Satisfaction With Public Transport in Their Area



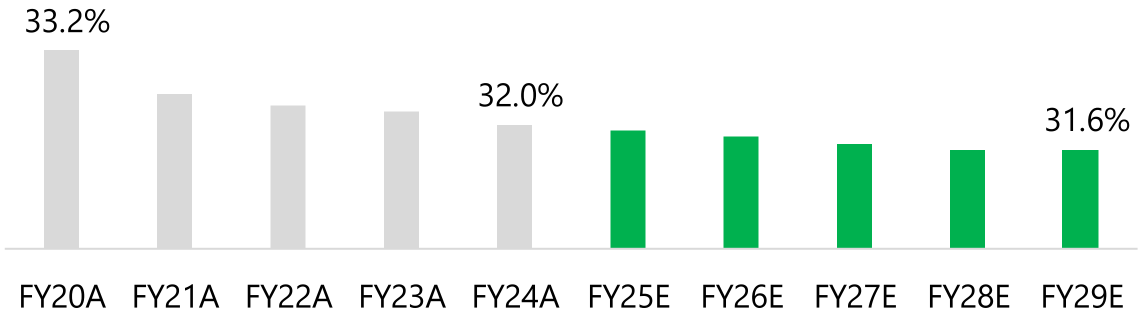
Poor Public Transport Infrastructure within several of Grab's key operating geographies can drive greater demand for their ride-hailing services

Unaffordable Private Cars in Singapore…

Singapore's Rising COE Prices



Singapore's Declining Car Ownership



Middle-Class Households are increasingly priced out of purchasing cars in Singapore, driving greater demand for ride-hailing services

Source: Statista, Singapore LTA

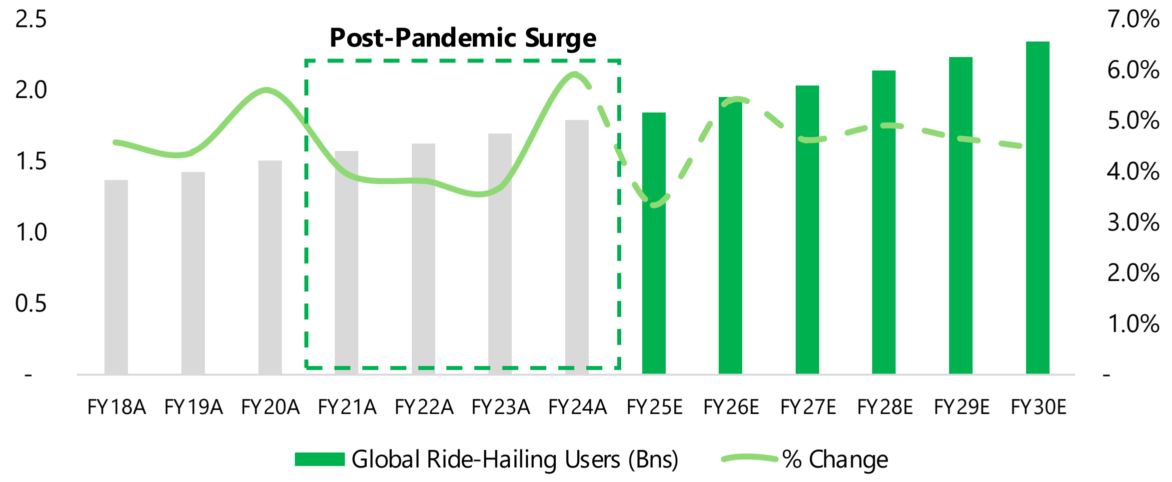
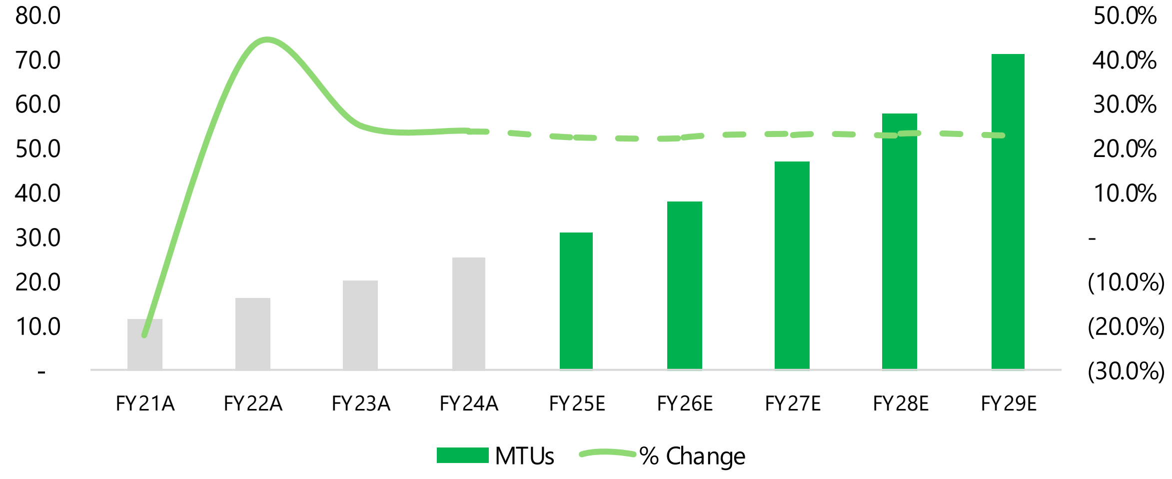
Explosive Growth Catalysed By Drivers Mentioned in Our Thesis

Volume Growth Stabilises After Transitory Post-Pandemic Surge





Projected volume growth was modelled to normalise against FY24A to account for the post pandemic boom

Growth That Reflects Grab's Premium Positioning

Grab's large market share, strong superapp synergies, alongside the tailwinds presented in our thesis calls for a elevated growth trajectory

23% CAGR — Volume build was derived from a revenue weighted growth rate between Grab's operating geographies, using macro data as growth drivers

2.3% CAGR — Unit price growth was derived from a revenue weighted rate between Grab's operating geographies, using inflation as the growth driver

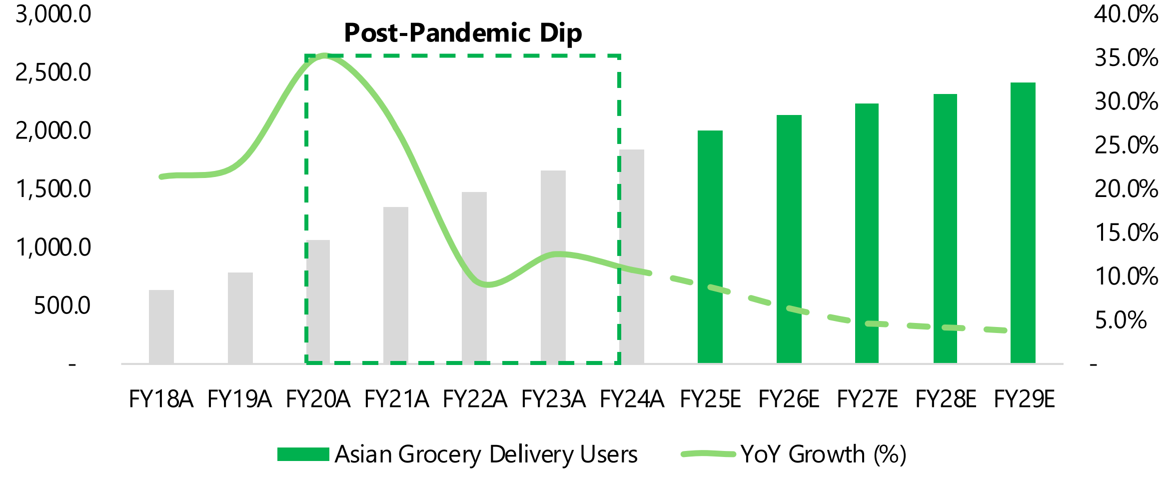
Source: Company Filings, Statista, Team Analysis

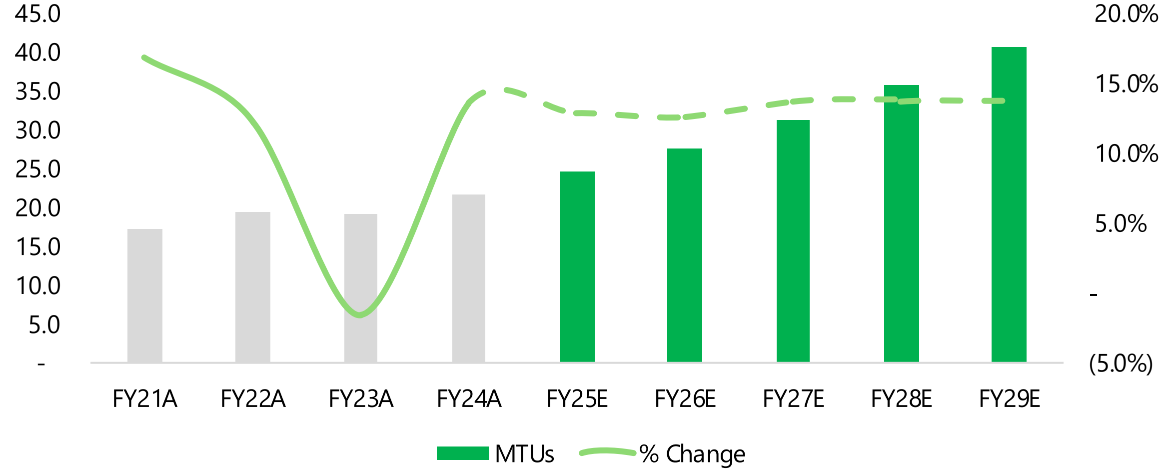
Appendix E4 | Deliveries Revenue Analysis

Back to Directory

Our 19.4% Deliveries Revenue CAGR is Conservative Compared to Historical and Forecasted Industry Growth Rates

Volume Growth Stabilises After Pandemic Surge





Projected volume growth was modelled to moderate after the post pandemic volume plunge

Conservative Estimates Ensures Margin of Safety

The oligopolistic deliveries industry calls for a conservative growth rate to avoid competitive undercutting

13% CAGR

Volume build was derived from a revenue weighted growth rate between Grab's operating geographies, using macro data as growth drivers

2.3% CAGR

Unit price growth was derived from a revenue weighted rate between Grab's operating geographies, using inflation as the growth driver

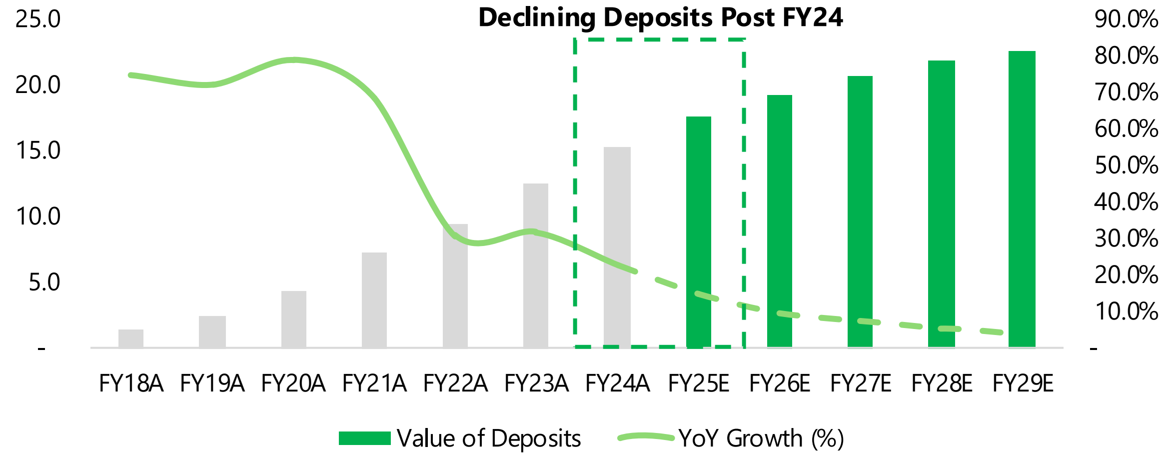
Source: Company Filings, Statista, Team Analysis

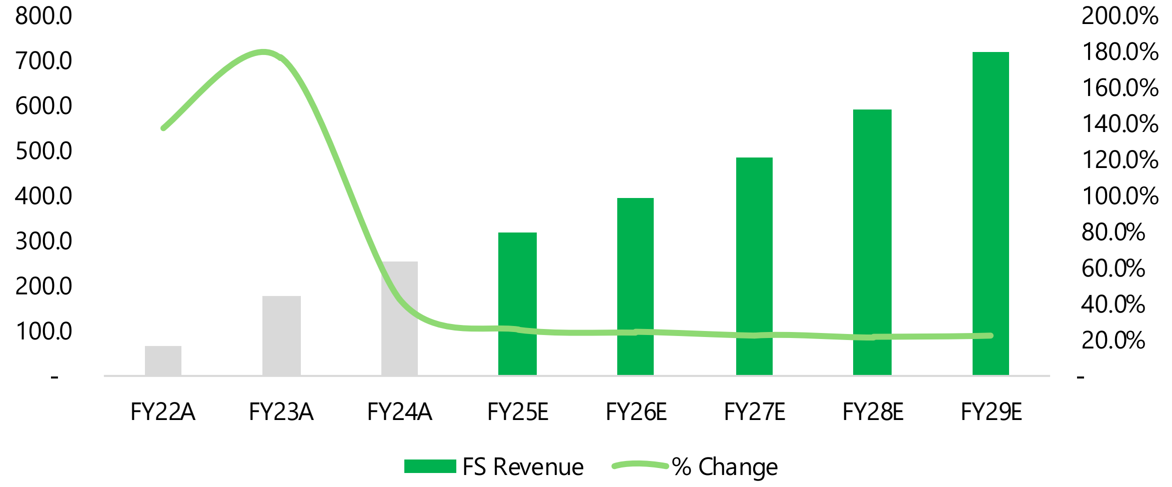
Appendix E5 | Financial Services Revenue Analysis

Back to Directory

An Early Stage Growth Platform Poised for Robust Growth…

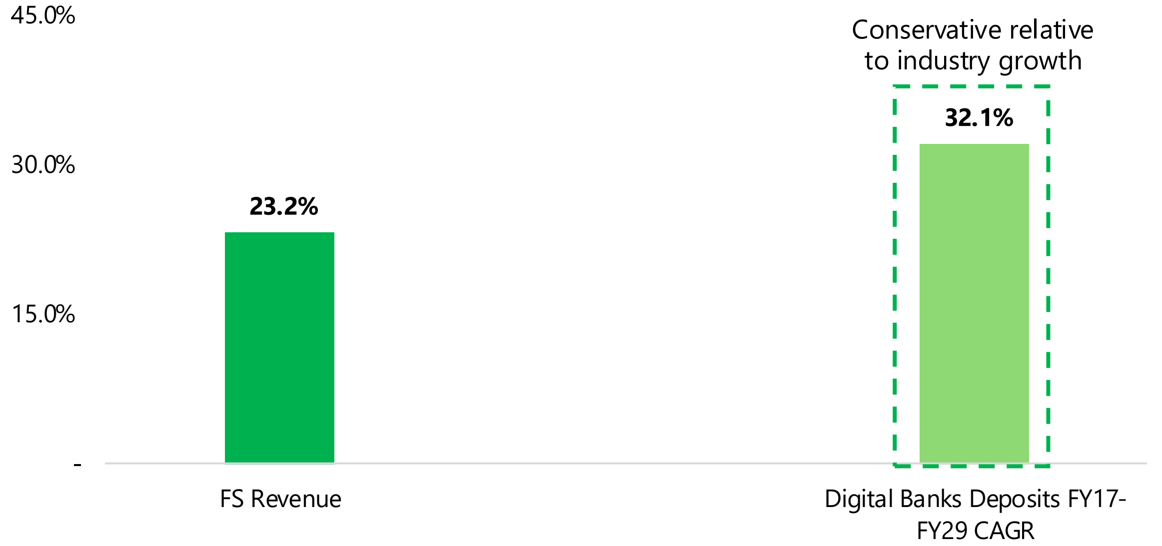
Early Stage Explosive Growth Normalising





Projected FS revenue projected to moderate and decline slightly post FY24 to reflect broader macroeconomic trends

Conservative Estimates Ensures Margin of Safety



Revenue CAGR above projected FY25-29 growth rates to reflect the early stage growth of DFS but below the long term CAGR for a margin of safety

21% CAGR

Volume build was derived from a revenue weighted growth rate between Grab's operating geographies, using macro data as growth drivers

2.3% CAGR

Unit price growth was derived from a revenue weighted rate between Grab's operating geographies, using inflation as the growth driver

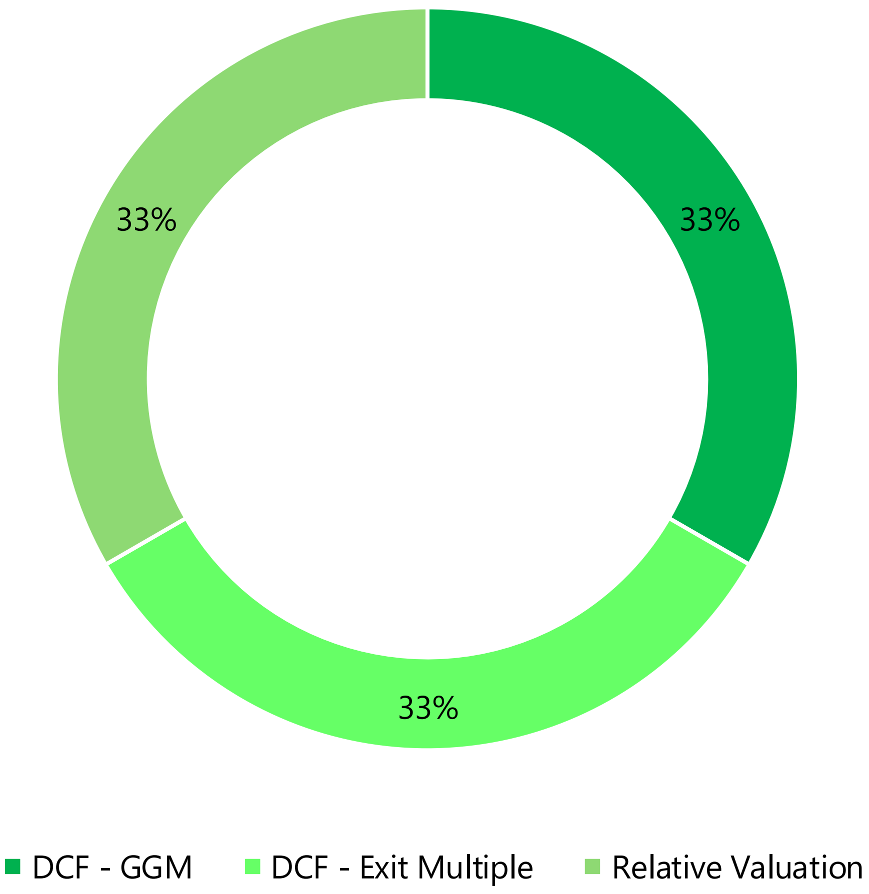
Appendix E8 | Methodology Weighting

Back to Directory

We Utilised a Blended Valuation Methodology, Based on Intrinsic (67%) and Extrinsic (33%) Valuation

We Used a Mix of Intrinsic (80%) and Relative (20%) Valuation…



…to Balance Their Overall Strengths and Weaknesses

Method	Rationale
Intrinsic Valuation DCF – GGM (33.3%)	• Accounts for key operating drivers and high operating leverage to drive Grab's increased profitability • Steady state assumptions are likely to be premature as Grab is still expanding across geographies and verticals
Intrinsic Valuation DCF – EMM (33.3%)	• Reflects how platforms like Grab are actually priced once profitability is already established • As Grab's EBITDA expands, exit multiple valuation captures the upside from operating leverage • Makes assumptions about future market sentiments which may differ materially at exit
Relative Valuation CY+1 EV/EBITDA (33.3%)	• Aligns with the forward looking nature of our valuation • Using EV/EBITDA allows for fair comparison between peers by maintaining capital structure neutrality • Accounts for uncertainty in Free Cash Flow projections, using a market view to asses Grab's valuation relative to peers • Grab lacks truly comparable peers besides Uber and potentially Gojek, other companies are not perfectly comparable

$7.20

We used a mix of valuation methodologies in order to ensure a reliable and well rounded approach towards deriving our price target

Appendix E13 | Cost of Debt Methodology Rationale

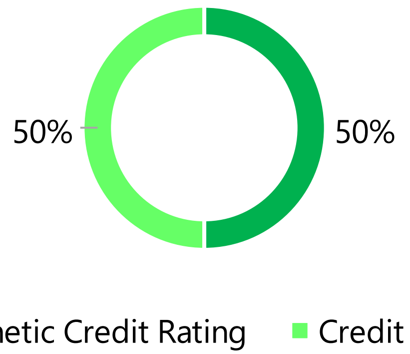
Back to Directory

Optimal Approach for Cost of Debt Estimation…

Evaluating Cost of Debt Methodologies for Accurate Pricing

Methodology	Selection Outcome	Rationale	Weightage
Synthetic Credit Rating	Yes	**Anchored in Company Fundamentals:** Derived from balance sheet strength, interest coverage, leverage and cash flow metrics. This ties the rating closely to the firm's underlying financial health rather than the market sentiment.	50%
Weighted Average Interest Rate on Hybrid Debt	No	**Inaccurate:** Historical Borrowing costs may not align with current market rates, refinancing costs or changes in Grab's credit risk and debt structure.	0%
Credit Spreads	Yes	**Reliability:** Ba3 and BB- rating issued by Moody's and S&P Global Ratings, which are credible rating agencies. **Forward Looking:** The credit rating accounts for each rating agency's expectations on Grab's capital management strategies.	50%

CoD Weightage



Weightage Reasoning

No.	Reason
1.	Balances model-based and market-based approaches
2.	Reduces estimation bias from any single method
3.	Reflects transitional credit profile which benefits a company like Grab which is undergoing a margin inflection and has recently just turned profitable

Appendix E14 | Grab's Cost of Debt

Back to Directory

Blended Values for Valuation Robustness…

Cost of Debt

Risk-Free Rate - US 10Y Government Bond Yield	4.08%
Average ICR	(3.0)x
Synthetic Credit Rating	D2/D
Actual Credit Rating	BB-/Ba3
Default risk spread - Damodaran's Estimates	10.81%
Pre-Tax Cost of Debt	**14.88%**
Tax Rate	21.5%
After-Tax Cost of Debt	**11.68%**

A Revenue Weighted Tax Rate

Country	Revenue (USD Mn)	Weightage (%)	Tax Rate (%)
Singapore	578.0	20.7%	17.0%
Malaysia	816.0	29.2%	24.0%
Indonesia	643.0	23.0%	22.0%
Philippines	265.0	9.5%	25.0%
Thailand	252.0	9.0%	20.0%
Vietnam	228.0	8.2%	20.0%
Rest of Southeast Asia	15.0	0.5%	23.4%
Cambodia			20.0%
Laos			26.9%
Revenue Weighted Tax Rate			**21.5%**

Default Risk Spread: The default risk spread (10.81%) was derived from a blended average of the latest credit rating benchmarks provided by NYU Damodaran.

Pre-Tax Cost of Debt: We applied Grab's default spread to the risk-free rate (US 10Y Note) to get a pre-tax cost of debt of 14.88%

Tax Rate: Country specific corporate tax rates were derived from the benchmarks provided by NYU Damodaran.

Rest of Southeast Asia: Tax rate for Rest of SEA was derived from a blended average of the Cambodia and Loas corporate tax rate.

Appendix E15 | Grab's Cost of Equity

Back to Directory

Assessing Grab's Cost of Equity for Informed Investment Decisions…

Cost of Equity Calculations and Breakdowns

Capital Asset Pricing Model (CAPM)	
Risk Free Rate	4.08%
Weighted Average Beta	0.68
Equity Risk Premium	6.28%
Country Risk Premium	2.07%
Cost of Equity	**10.43%**

Weighted Average Beta: Weighted Average (100%/0%) between a pure-play beta derived from Grab's selected peer group (0.68) and regression beta (1.03). Regression beta was not used in computation of Cost of Equity due to its historical bias, as we wanted to use a comparable companies adjusted beta to reflect a more forward looking and stable estimate for WACC calculation.

ERP & CRP: Derived from a revenue-weighted average between Grab's respective operating geographies ERP & CRP based off NYU Damodaran's latest estimates.

Country	Revenue (USD Mn)	Weightage (%)	ERP (%)
Singapore	578.0	20.7%	4.2%
Malaysia	816.0	29.2%	6.0%
Indonesia	643.0	23.0%	7.0%
Philippines	265.0	9.5%	7.0%

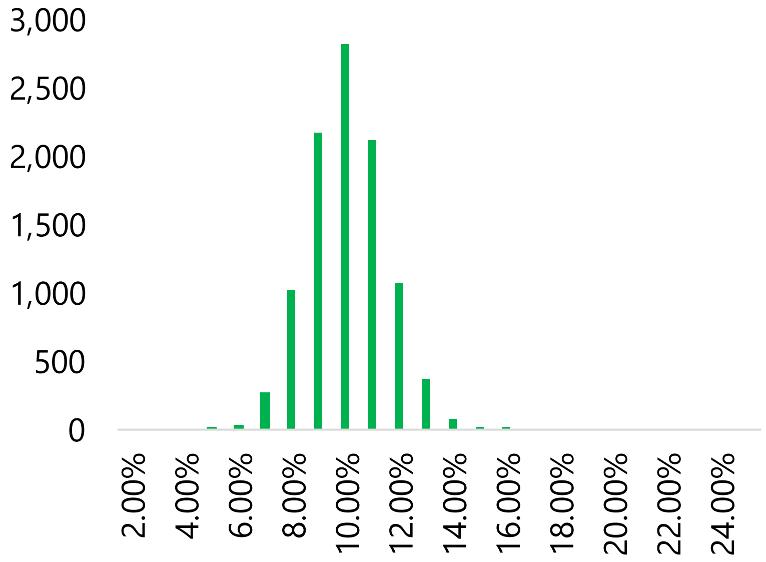
Appendix E17 | WACC Sensitivity Analysis

[Back to Directory](#)

Robust WACC That Upholds Regardless of Shocks…

Monte Carlo 10,000 Iterations on WACC



51% of Iterations were BELOW our WACC

Q1 WACC Still Above Both Industry Average WACC's

BOTH Average & Median are BELOW our WACC

Results			
Average:	10.55%	Max:	16.80%
Q1:	9.59%	Min:	5.42%
Q3:	11.47%	Median:	10.51%
Stdev:	1.41%		

A Monte Carlo Analysis was performed on our WACC in order to:

- Simultaneously vary uncertain variables such as the risk-free rate and equity risk premium rather than in isolation, providing a more realistic assessment.
- Incorporate covariance between the drivers of our discount rate as macroeconomic and market variables do not move independently. Interest rates, equity risk premiums, betas and credit spreads tend to co-move during periods of stress.

Key Factors of WACC

- Tax Rate
- Risk-Free Rate
- Equity-Risk Premium
- Country-Risk Premium
- Beta

were varied using a 20% standard deviation.

The highlights above represent the conservative nature of our valuations, with a relatively higher discount rate which helps provide an added margin of safety to our target price.

Appendix E20 | Scenario Comparison and Drivers 1

Back to Directory

Scenario Analysis Comparison…

Attractive Risk-Reward Profile Across Multiple Scenarios

	Bull	**Base**	**Bear**
Volume Growth	All operating geographies for each of Grab's business segments were grown at a 1.0% premium to base case to reflect volumes growth exceeding team expectations	Volume Growth was triangulated from macroeconomic drivers (consumer expenditure, tourism spending, digital payments) for each of Grab's operating geographies before a brand premium was added to reflect the companies premium positioning alongside flywheel effects	All operating geographies for each of Grab's business segments were grown 1.0% lower than base case to reflect volumes growth falling short of team expectations
Unit Price	All operating geographies for each of Grab's business segments were grown at a 1.0% premium to base case to reflect Grab's pricing power exceeding team expectations	ASP only grown by inflation of each of Grab's operating geographies for each of its core business segments. This was done to reflect the limited pricing power Grab has due to the nature of the on-demand services industry	All operating geographies for each of Grab's business segments were grown 1.0% lower than base case to reflect Grab's pricing power falling short of team expectations
Margins	Greater EBIT margin expansion (26.3%) in the event of investments into autonomous vehicles having a far greater impact and incentive spend being reduced further than expected	EBIT margin expansion to 20.8% in FY29E above consensus estimates, driven by reduced incentive spending, investments into autonomous vehicles and data driven cost cutting measures	Lower EBIT margin expansion (15.3%) in the event of incentive wars and investments into autonomous vehicles not having the expected impact on margins
Target Price	**$9.60**	**$7.20**	**$5.06**

Appendix E22 | Uber Exclusion From Peer Comp Selection

Back to Directory

We Excluded Uber From the Peer Comp Selection For Several Reasons…

Similar Business Model's Yet Uncomparable Companies

No.	Reason
1.	The two companies have fundamentally different geographic risk profiles. Uber operates primarily in developed markets such as the U.S. and Europe with deeper capital markets and stronger consumer purchasing power. Grab's earnings are concentrated in SEA where regulatory uncertainty and income volatility structurally higher. Uber's valuation commands a lower risk premium, making direct multiple comparison inappropriate.
2.	Uber faces mature and well defined regulations. Grab operates in a fragmented and evolving regulatory landscape across multiple SEA jurisdictions with greater exposure to policy shifts, labour rules and licensing constraints.
3.	Cost structures and unit economics of both companies are not aligned. Uber benefits from higher ARPU markets and more efficient driver supply dynamics. Grab operates in lower-ARPU, price sensitive markets, where incentives and take rates behave differently. As a result the companies EBITDA margins and take rates are structurally non-comparable.
4.	Ensuring peer selection consistency.

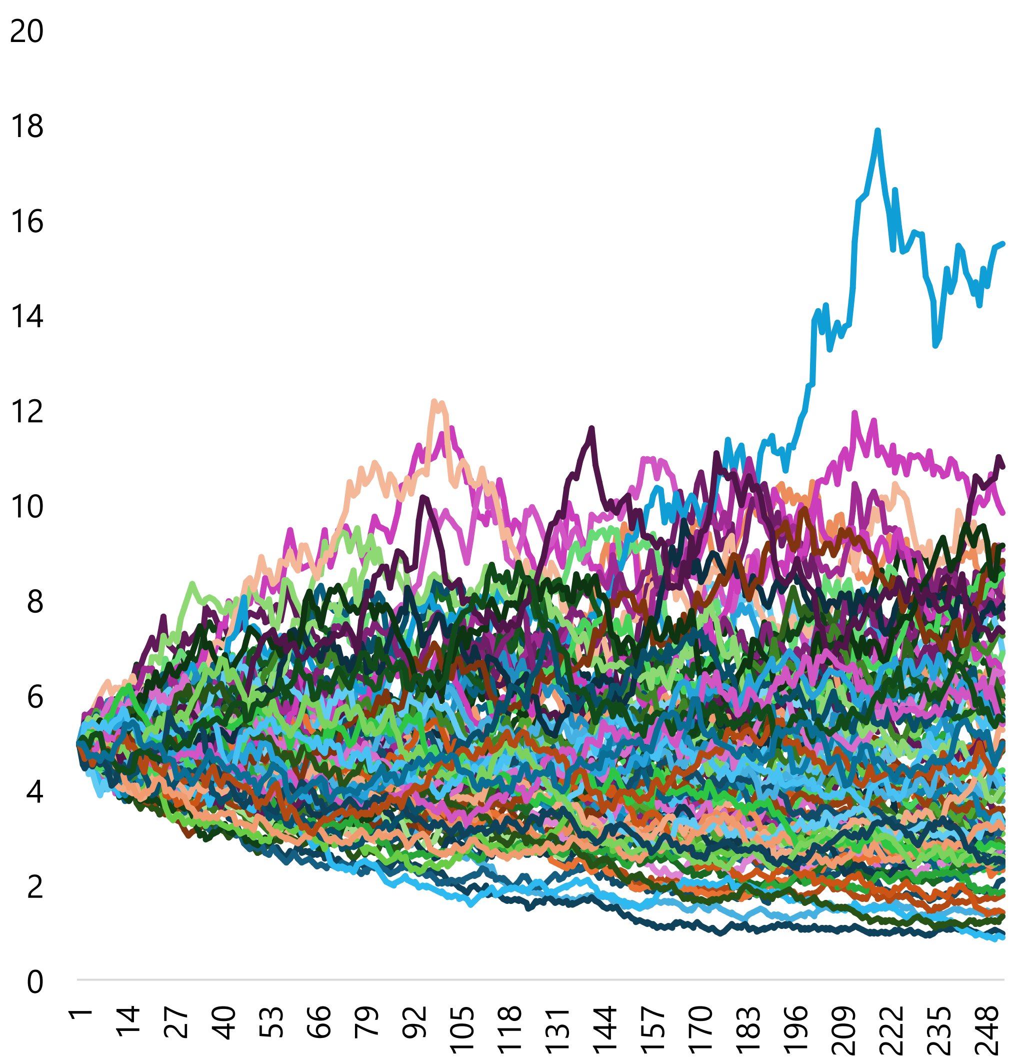
Appendix E25 | Geometric Brownian Motion

Back to Directory

A Conservative 4% Terminal Growth Rate Reflecting Long-Term GDP Growth…

Geometric Brownian Motion



In order to complement our target price, which was derived from a blended valuation (80% DCF, 20% Relative Valuation), we ran a price-action sanity check using a Geometric Brownian Motion simulation based off Grab's daily returns over the past 12 months. GBM assumes prices follow a lognormal process. We calculate the drift using the annualised mean of daily log returns and volatility using the annualised standard deviation from history, setting todays close as S0, and simulating 10,000 one-year paths (approximately 252 trading days).

Results: The simulated mean final price is US$5.19, with a right skewed distribution typical of GBM (See Histogram). The 5% one-year VAR is $1.93, implying that there is a 1 in 20 chance of having a downside outcome of $1.93, an implied loss of $3.06 from the starting price of $4.99. The standard deviation of 10,000 simulations of our final price was $2.88. On pure price action, this suggests that 1) an upside move from Grab's current prices are highly feasible 2) our overall 12 month target price, which remains within the upper quartile of Grab's simulated prices, is feasible under recent volatility and drift.

Read-Through To Target Price: Our fundamental (DCF only) target price of $8.12, using a 50-50 split between the Gordon Growth ($5.47) and Exit Multiple Method ($10.77) sits slightly over the upper quartile ($8.07). This is consistent with our thesis regarding robust tourism spending growth, ride-hailing's growth as a percentage of total transportation, Grab's reduction of incentives as a percentage of GMV and their innovative investments which drive incremental cost savings. Our relative valuation (EV/CY+1 EBITDA) provides an external market anchor that helps bound this upside.

Interpretation: Our GBM simulation is not a driver of the target price, it is a sanity check on the feasibility of the target price under recent (last 12 months) trading dynamics. It doesn't incorporate changes in fundamentals, competitive behaviour, regulations or macroeconomic shocks due to its backward-looking nature. As such, we view the simulation as supportive of our base case rather than determinative, with the DCF remaining the binding anchor and the relative valuation providing market-consistent guardrails.

Appendix G2 | Regulatory Tailwinds

Back to Directory

In the wake of Grab's acquisition of Uber, CCCS found evidence the merged entity could raise effective prices and reduce incentives, with competitive pressures from Uber removed. In response, CCCS required Grab to maintain its pre-merger pricing algorithm, base fares, surge factor caps, and driver commission rates. This was designed to protect riders from excessive price increases and drivers from higher commission costs, while keeping the market more contestable for rivals.

Benefits: While frequently viewed as a significant limitation, CCCS has not banned dynamic pricing altogether, indicating that regulators are willing to allow some level of surge pricing. This reflects a pragmatic approach that balances consumer protection with the need for Grab to manage supply and demand efficiently, demonstrating that the authorities are not completely hostile toward platform pricing innovation. Furthermore, CCCS's surge factor caps and pre-merger algorithm requirements create a more predictable earnings environment for drivers, helping Grab maintain a stable supply of drivers during peak demand. This reduces the need for excessive incentive payments to attract drivers, supporting operational efficiency and sustaining EBITDA margins.

Malaysia's competition watchdog (MyCC) and transport regulators have stepped up monitoring and enforcement of ride-hailing platforms to ensure compliance with competition law, licensing, and safety standards. This includes scrutiny of dominant firms like Grab for potential abuse of market power, investigations into restrictive driver practices, proposed fines for anti-competitive conduct, and ongoing oversight of pricing and contract terms under the Competition Act 2010.

Benefits: Greater regulatory oversight reduces the likelihood of unrestrained price undercutting or exclusionary conduct that could distort competition. For Grab, this environment encourages more disciplined pricing behaviour and contractual transparency, lessening the need for aggressive discounting to defend market share and supporting healthier unit economics. A more stable competitive landscape helps preserve margins by reducing fare wars and the associated cost pressures on driver incentives and subsidies.

Indonesia's Ministry of Transportation has implemented regulations that set minimum and maximum tariffs (price floors and ceilings) for app-based ride-hailing services to prevent excessively low pricing. These rules, introduced through ministerial decrees (e.g., Permen/KP regulations on fare limits and tariff calculation guidelines), establish zonal fare bands, minimum per-kilometre rates and safety and service standards for drivers and platforms to follow. The objective is to provide legal protection for drivers and passengers, safeguard fair competition, and curb unsustainable fare undercutting that previously proliferated in the absence of formal pricing frameworks.

Benefits: The MYCC price floor reduces destructive fare undercutting, encouraging a new market regime where price wars are less likely and competitors no longer need to compete aggressively on fares. This allows Grab to maintain sustainable revenue per ride, supports healthier unit economics, and protects margins, while predictable driver earnings reduce the need for high incentive payments, further stabilizing EBITDA.
